    }
  }
}
```

delete

Usage:

```
am> delete OAuth2Clients --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action OAuth2Clients --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action OAuth2Clients --realm Realm --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action OAuth2Clients --realm Realm --actionName nextdescendents
```

query

Querying the agents of a specific type

Usage:

```
am> query OAuth2Clients --realm Realm --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read OAuth2Clients --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update OAuth2Clients --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "coreOAuth2ClientConfig" : {
      "type" : "object",

OAuth2Module

Realm Operations

Resource path: `/realm-config/authentication/modules/oauth2`

Resource version: `1.0`

create

Usage:

```
am> create OAuth2Module --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "smtpHostName" : {
      "title" : "SMTP host",
      "description" : "The mail host that will be used by the Email Gateway implementation",

```

delete

Usage:

```
am> delete OAuth2Module --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action OAuth2Module --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action OAuth2Module --realm Realm --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action OAuth2Module --realm Realm --actionName nextdescendents
```

query

Get the full list of instances of this collection. This query only supports `_queryFilter=true` filter.

Usage:

```
am> query OAuth2Module --realm Realm --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read OAuth2Module --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update OAuth2Module --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{

Global Operations

Resource path: `/global-config/authentication/modules/oauth2`

Resource version: `1.0`

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action OAuth2Module --global --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action OAuth2Module --global --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action OAuth2Module --global --actionName nextdescendents
```

read

Usage:

```
am> read OAuth2Module --global
```

update

Usage:

```
am> update OAuth2Module --global --body body
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "defaults" : {
      "properties" : {
        "oauth2EmailAttribute" : {
          "title" : "Email attribute in OAuth2 Response",
          "description" : "Attribute from the OAuth2 response used to send activation code
 emails.<br><br>The attribute in the response from the profile service in the OAuth 2.0 Provider that
```

```
 contains the email address of the authenticated user. This address will be used to send an email with
 an activation code when the accounts are allowed to be created dynamically.",

OAuth2Provider

Realm Operations

Resource path: `/realm-config/services/oauth-oidc`

Resource version: `1.0`

create

Usage:

```
am> create OAuth2Provider --realm Realm --body body
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "advancedOAuth2Config" : {
      "type" : "object",

  }
}
```

delete

Usage:

```
am> delete OAuth2Provider --realm Realm
```

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action OAuth2Provider --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action OAuth2Provider --realm Realm --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action OAuth2Provider --realm Realm --actionName nextdescendents
```

read

Usage:

```
am> read OAuth2Provider --realm Realm
```

update

Usage:

```
am> update OAuth2Provider --realm Realm --body body
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "advancedOAuth2Config" : {
      "type" : "object",

```

Global Operations

Resource path: `/global-config/services/oauth-oidc`

Resource version: `1.0`

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action OAuth2Provider --global --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action OAuth2Provider --global --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action OAuth2Provider --global --actionName nextdescendents
```

read

Usage:

```
am> read OAuth2Provider --global
```

update

Usage:

```
am> update OAuth2Provider --global --body body
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "storageScheme" : {
      "title" : "CTS Storage Scheme",

OAuth2RemoteConsentAgentGroups

Realm Operations

Agent Groups handler that is responsible for managing agent groups

Resource path: `/realm-config/agents/groups/RemoteConsentAgent`

Resource version: `1.0`

create

Usage:

```
am> create OAuth2RemoteConsentAgentGroups --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "remoteConsentResponseEncryptionMethod" : {
      "title" : "Consent response encryption method",
      "description" : "The encryption method to be used by the provider when decrypting the remote
 consent response JWT received from the Remote Consent Service.<br><br>AM supports the following token
```

```
 encryption algorithms: <ul><li><code>A128GCM</code>, <code>A192GCM</code>, and <code>A256GCM</code> -
 AES in Galois Counter Mode (GCM) authenticated encryption mode.</li><li><code>A128CBC-HS256</code>,
 <code>A192CBC-HS384</code>, and <code>A256CBC-HS512</code> - AES encryption in CBC mode, with HMAC-
SHA-2 for integrity.</li></ul>",
      "propertyOrder" : 34600,
      "required" : true,
      "type" : "string",
      "exampleValue" : ""
    },
    "remoteConsentRequestSigningAlgorithm" : {
      "title" : "Consent request Signing Algorithm",
      "description" : "Signing algorithm to be used when signing the consent request JWT.",
      "propertyOrder" : 34500,
      "required" : true,
      "type" : "string",
      "exampleValue" : ""
    },
    "jwksUri" : {
      "title" : "Json Web Key URI",
      "description" : "The URI containing the public keys of the Remote Consent Service secret. The
 public keys are in the Json Web Key (jwk) format.",

    }
  }
}
```

delete

Usage:

```
am> delete OAuth2RemoteConsentAgentGroups --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action OAuth2RemoteConsentAgentGroups --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action OAuth2RemoteConsentAgentGroups --realm Realm --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action OAuth2RemoteConsentAgentGroups --realm Realm --actionName nextdescendents
```

query

Querying the agent groups of a specific type

Usage:

```
am> query OAuth2RemoteConsentAgentGroups --realm Realm --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read OAuth2RemoteConsentAgentGroups --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update OAuth2RemoteConsentAgentGroups --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "remoteConsentResponseEncryptionMethod" : {
      "title" : "Consent response encryption method",

    }
  }
}
```

delete

Usage:

```
am> delete OAuth2SoftwarePublisherAgentGroups --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action OAuth2SoftwarePublisherAgentGroups --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action OAuth2SoftwarePublisherAgentGroups --realm Realm --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action OAuth2SoftwarePublisherAgentGroups --realm Realm --actionName nextdescendents
```

query

Querying the agent groups of a specific type

Usage:

```
am> query OAuth2SoftwarePublisherAgentGroups --realm Realm --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read OAuth2SoftwarePublisherAgentGroups --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update OAuth2SoftwarePublisherAgentGroups --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "jwkSet" : {
      "title" : "Json Web Key",

    }
  }
}
```

delete

Usage:

```
am> delete OAuth2TrustedJWTIssuerAgentGroups --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action OAuth2TrustedJWTIssuerAgentGroups --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action OAuth2TrustedJWTIssuerAgentGroups --realm Realm --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action OAuth2TrustedJWTIssuerAgentGroups --realm Realm --actionName nextdescendents
```

query

Querying the agent groups of a specific type

Usage:

```
am> query OAuth2TrustedJWTIssuerAgentGroups --realm Realm --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read OAuth2TrustedJWTIssuerAgentGroups --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update OAuth2TrustedJWTIssuerAgentGroups --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "jwksUri" : {
      "title" : "JWKs URI",
      "description" : "URI to retrieve JWK verification keys from to validate the JWT signature.",

    }
  }
}
```

OAuth2UserApplications

Realm Operations

This endpoint exposes a list of all the applications (clients) that the user authorized using OAuth 2.0. Access for those applications can then be revoked on a per-client basis.

Resource path: `/users/{user}/oauth2/applications`

Resource version: `1.1`

delete

Delete the tokens for the specified client ID.

Usage:

```
am> delete OAuth2UserApplications --realm Realm --id id --user user
```

Parameters:

`--id`

The unique identifier for the resource.

--user

This endpoint exposes a list of all the applications (clients) that the user authorized using OAuth 2.0. Access for those applications can then be revoked on a per-client basis.

query

Get a list of the applications that have been granted OAuth 2.0 access. Only `_queryFilter=true` is supported.

Usage:

```
am> query OAuth2UserApplications --realm Realm --filter filter --user user
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

--user

This endpoint exposes a list of all the applications (clients) that the user authorized using OAuth 2.0. Access for those applications can then be revoked on a per-client basis.

OIDCClient

Realm Operations

Resource path: `/realm-config/services/SocialIdentityProviders/oidcConfig`

Resource version: `1.0`

create

Usage:

```
am> create OIDCClient --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "wellKnownEndpoint" : {
      "title" : "Well Known Endpoint",
      "description" : "The endpoint for retrieving a list of OAuth/OIDC endpoints.",
      "propertyOrder" : 1200,
      "required" : true,

    }
  }
}
```

delete

Usage:

```
am> delete OIDCClient --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action OIDCClient --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action OIDCClient --realm Realm --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action OIDCClient --realm Realm --actionName nextdescendents
```

query

Get the full list of instances of this collection. This query only supports `_queryFilter=true` filter.

Usage:

```
am> query OIDCClient --realm Realm --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read OIDCClient --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update OIDCClient --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "wellKnownEndpoint" : {
      "title" : "Well Known Endpoint",

OTPCollectorDecision

Realm Operations

Resource path: `/realm-config/authentication/authenticationtrees/nodes/OneTimePasswordCollectorDecisionNode`

Resource version: `1.0`

create

Usage:

```
am> create OTPCollectorDecision --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "passwordExpiryTime" : {
      "title" : "One Time Password Validity Length",
      "description" : "This One Time Password will remain valid for this period in minutes.",
      "propertyOrder" : 100,
      "type" : "integer",
      "exampleValue" : ""
    }
  },
  "required" : [ "passwordExpiryTime" ]
}
```

delete

Usage:

```
am> delete OTPCollectorDecision --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action OTPCollectorDecision --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action OTPCollectorDecision --realm Realm --actionName getCreatableTypes
```

listOutcomes

List the available outcomes for the node type.

Usage:

```
am> action OTPCollectorDecision --realm Realm --body body --actionName listOutcomes
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "title" : "Some configuration of the node. This does not need to be complete against the
 configuration schema."
}
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action OTPCollectorDecision --realm Realm --actionName nextdescendents
```

query

Get the full list of instances of this collection. This query only supports `_queryFilter=true` filter.

Usage:

```
am> query OTPCollectorDecision --realm Realm --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read OTPCollectorDecision --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update OTPCollectorDecision --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "passwordExpiryTime" : {
      "title" : "One Time Password Validity Length",
      "description" : "This One Time Password will remain valid for this period in minutes.",
      "propertyOrder" : 100,
      "type" : "integer",
      "exampleValue" : ""
    }
  },
  "required" : [ "passwordExpiryTime" ]
}
```

OTPEmailSender

Realm Operations

Resource path: `/realm-config/authentication/authenticationtrees/nodes/OneTimePasswordSmtpSenderNode`

Resource version: `1.0`

create

Usage:

```
am> create OTPEmailSender --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "fromEmailAddress" : {
      "title" : "Email From Address",
      "description" : "Emails from the OTP Email Sender node will come from this address.",
      "propertyOrder" : 600,
      "type" : "string",
      "exampleValue" : ""
    },
    "smsGatewayImplementationClass" : {
      "title" : "Gateway Implementation Class",
      "description" : "The OTP Email Sender node uses this class to send email
 messages. <br><br>The gateway class must implement the following interface:
 <br><code>com.sun.identity.authentication.modules.hotp.SMSGateway</code>",
      "propertyOrder" : 2200,
      "type" : "string",
      "exampleValue" : ""
    },
    "sslOption" : {
      "title" : "Mail Server Secure Connection",
      "description" : "This setting controls whether the authentication module communicates with the
 mail server using SSL/TLS.",
      "propertyOrder" : 2100,
      "type" : "string",
      "exampleValue" : ""
    },
    "hostPort" : {
      "title" : "Mail Server Host Port",
      "description" : "The port of the mail server. The default port for SMTP is 25, if using SSL the
 default port is 465.",
      "propertyOrder" : 300,
      "type" : "integer",
      "exampleValue" : ""
    },
    "emailAttribute" : {
      "title" : "Email Attribute Name",
      "description" : "This is the attribute name used by the OTP Sender to email the user.",
      "propertyOrder" : 1100,
      "type" : "string",
      "exampleValue" : ""
    },
    "password" : {
      "title" : "Mail Server Authentication Password",
```

```
      "description" : "The password to use when the mail server is using SMTP authentication.",
      "propertyOrder" : 500,
      "type" : "string",
      "format" : "password",
      "exampleValue" : ""
    },
    "username" : {
      "title" : "Mail Server Authentication Username",
      "description" : "The username to use when the mail server is using SMTP authentication.",
      "propertyOrder" : 400,
      "type" : "string",
      "exampleValue" : ""
    },
    "hostName" : {
      "title" : "Mail Server Host Name",
      "description" : "The name of the mail server OpenAM will use to send the messages.",
      "propertyOrder" : 200,
      "type" : "string",
      "exampleValue" : ""
    }
  },
  "required" : [ "password", "fromEmailAddress", "smsGatewayImplementationClass", "username",
 "hostName", "sslOption", "emailAttribute", "hostPort" ]
}
```

delete

Usage:

```
am> delete OTPEmailSender --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action OTPEmailSender --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action OTPEmailSender --realm Realm --actionName getCreatableTypes
```

listOutcomes

List the available outcomes for the node type.

Usage:

```
am> action OTPEmailSender --realm Realm --body body --actionName listOutcomes
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "title" : "Some configuration of the node. This does not need to be complete against the
 configuration schema."
}
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action OTPEmailSender --realm Realm --actionName nextdescendents
```

query

Get the full list of instances of this collection. This query only supports `_queryFilter=true` filter.

Usage:

```
am> query OTPEmailSender --realm Realm --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read OTPEmailSender --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update OTPEmailSender --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "fromEmailAddress" : {
      "title" : "Email From Address",
      "description" : "Emails from the OTP Email Sender node will come from this address.",
      "propertyOrder" : 600,
      "type" : "string",
      "exampleValue" : ""
    },
    "smsGatewayImplementationClass" : {
      "title" : "Gateway Implementation Class",

}
```

delete

Usage:

```
am> delete OTPSMSSender --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action OTPSMSSender --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action OTPSMSSender --realm Realm --actionName getCreatableTypes
```

listOutcomes

List the available outcomes for the node type.

Usage:

```
am> action OTPSMSSender --realm Realm --body body --actionName listOutcomes
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "title" : "Some configuration of the node. This does not need to be complete against the
 configuration schema."
}
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action OTPSMSSender --realm Realm --actionName nextdescendents
```

query

Get the full list of instances of this collection. This query only supports `_queryFilter=true` filter.

Usage:

```
am> query OTPSMSSender --realm Realm --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read OTPSMSSender --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update OTPSMSSender --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {

    },
    "hotpCounterAttribute" : {
      "title" : "Counter Attribute Name",
      "description" : "The name of the attribute in the user profile to store the user counter. This
 is required if HOTP is chosen as the OATH algorithm.",
      "propertyOrder" : 700,
      "required" : true,
      "type" : "string",
      "exampleValue" : ""
    }
  }
}
```

delete

Usage:

```
am> delete OathModule --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action OathModule --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action OathModule --realm Realm --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action OathModule --realm Realm --actionName nextdescendents
```

query

Get the full list of instances of this collection. This query only supports `_queryFilter=true` filter.

Usage:

```
am> query OathModule --realm Realm --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read OathModule --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update OathModule --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{

```

Global Operations

Resource path: `/global-config/authentication/modules/oath`

Resource version: `1.0`

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action OathModule --global --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action OathModule --global --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action OathModule --global --actionName nextdescendents
```

read

Usage:

```
am> read OathModule --global
```

update

Usage:

```
am> update OathModule --global --body body
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {

OathUserDevices

Realm Operations

The Oath devices service is responsible for exposing functions to change the collection of OATH authentication devices. The supported methods are action, delete, query

Resource path: `/users/{user}/devices/2fa/oath`

Resource version: `1.0`

check

Checks if the user's Authenticator OATH module is 'skippable' and returns the result as a boolean

Usage:

```
am> action OathUserDevices --realm Realm --body body --user user --actionName check
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "$schema" : "http://json-schema.org/draft-04/schema#",
  "description" : "OATH user device check action request schema",
  "type" : "object",
  "title" : "OATH user device check action request schema"
}
```

--user

The Oath devices service is responsible for exposing functions to change the collection of OATH authentication devices. The supported methods are action, delete, query

delete

Delete OATH user device

Usage:

```
am> delete OathUserDevices --realm Realm --id id --user user
```

Parameters:

--id

The unique identifier for the resource.

--user

The Oath devices service is responsible for exposing functions to change the collection of OATH authentication devices. The supported methods are action, delete, query

query

Query the user's device profile

Usage:

```
am> query OathUserDevices --realm Realm --filter filter --user user
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all. Fields that can be queried: [*]

--user

The Oath devices service is responsible for exposing functions to change the collection of OATH authentication devices. The supported methods are action, delete, query

reset

Sets the user's 'skippable' selection of Authenticator OATH module to default (NOT_SET) and deletes their profiles attribute

Usage:

```
am> action OathUserDevices --realm Realm --body body --user user --actionName reset
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "description" : "OATH user device reset action request schema",
  "type" : "object",
  "title" : "OATH user device reset action request schema"
}
```

--user

The Oath devices service is responsible for exposing functions to change the collection of OATH authentication devices. The supported methods are action, delete, query

skip

Sets the user's ability to skip an Authenticator OATH module

Usage:

```
am> action OathUserDevices --realm Realm --body body --user user --actionName skip
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "description" : "OATH user device skip action request schema",
  "type" : "object",
  "title" : "OATH user device skip action request schema",
  "properties" : {
    "value" : {
      "type" : "boolean",
      "title" : "Skip OATH module response value",
      "description" : "True if the OATH device is set to skipped"
    }
  },
  "required" : [ "value" ]
}
```

--user

The Oath devices service is responsible for exposing functions to change the collection of OATH authentication devices. The supported methods are action, delete, query

OpenDJ

Realm Operations

Resource path: `/realm-config/services/id-repositories/LDAPv3ForOpenDS`

Resource version: `1.0`

create

Usage:

```
am> create OpenDJ --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "groupconfig" : {
      "type" : "object",

        }
      }
    }
  }
}
```

delete

Usage:

```
am> delete OpenDJ --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action OpenDJ --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action OpenDJ --realm Realm --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action OpenDJ --realm Realm --actionName nextdescendents
```

query

Get the full list of instances of this collection. This query only supports `_queryFilter=true` filter.

Usage:

```
am> query OpenDJ --realm Realm --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read OpenDJ --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update OpenDJ --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```

OpenIDConnect

Realm Operations

Resource path: `/realm-config/authentication/authenticationtrees/nodes/SocialOpenIdConnectNode`

Resource version: `1.0`

create

Usage:

```
am> create OpenIDConnect --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "cfgMixUpMitigation" : {
      "title" : "OAuth 2.0 Mix-Up Mitigation Enabled",
      "description" : "Enables OAuth 2.0 mix-up mitigation The authorization server must support
 the OAuth 2.0 Mix-Up Mitigation draft (https://tools.ietf.org/html/draft-ietf-oauth-mix-up-
mitigation-01#section-3.1), otherwise OpenAM will fail to validate responses from the authorization
 server. If only the OAuth 2.0 protocol is utilized, make sure that the accepted issuer value is set
 in the \"Token Issuer\" setting.",

}
```

delete

Usage:

```
am> delete OpenIDConnect --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action OpenIDConnect --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action OpenIDConnect --realm Realm --actionName getCreatableTypes
```

listOutcomes

List the available outcomes for the node type.

Usage:

```
am> action OpenIDConnect --realm Realm --body body --actionName listOutcomes
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "title" : "Some configuration of the node. This does not need to be complete against the
 configuration schema."
}
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action OpenIDConnect --realm Realm --actionName nextdescendents
```

query

Get the full list of instances of this collection. This query only supports `_queryFilter=true` filter.

Usage:

```
am> query OpenIDConnect --realm Realm --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read OpenIDConnect --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update OpenIDConnect --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```

OpenIdConnectModule

Realm Operations

Resource path: `/realm-config/authentication/modules/openidconnect`

Resource version: `1.0`

create

Usage:

```
am> create OpenIdConnectModule --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "cryptoContextType" : {
      "title" : "OpenID Connect validation configuration type",
      "description" : "Please select either 1. the issuer discovery url, 2. the issuer jwk url, or 3.
 the client_secret.",
      "propertyOrder" : 200,
      "required" : true,
      "type" : "string",
      "exampleValue" : ""
    },
    "principalMapperClass" : {
      "title" : "Principal mapper class",
      "description" : "Class which implements mapping of jwt state to a Principal in
 the local identity repository<br><br>Any custom implementation must implement the
 <code>org.forgerock.openam.authentication.modules.common.mapping.AttributeMapper</code> interface.",
      "propertyOrder" : 900,
      "required" : true,
      "type" : "string",
      "exampleValue" : ""
    },
    "idTokenIssuer" : {
      "title" : "Name of OpenID Connect ID Token Issuer",
      "description" : "Value must match the iss field in issued ID Token",
      "propertyOrder" : 500,
      "required" : true,
      "type" : "string",
      "exampleValue" : ""
    },
    "audienceName" : {
      "title" : "Audience name",
      "description" : "A case sensitive string<br><br>The audience name for this OpenID Connect
 module. This will be used to check that the ID token received is intended for this module as an
 audience.",

      "type" : "string",
      "exampleValue" : ""
    }
  }
}
```

delete

Usage:

```
am> delete OpenIdConnectModule --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action OpenIdConnectModule --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action OpenIdConnectModule --realm Realm --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action OpenIdConnectModule --realm Realm --actionName nextdescendents
```

query

Get the full list of instances of this collection. This query only supports `_queryFilter=true` filter.

Usage:

```
am> query OpenIdConnectModule --realm Realm --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read OpenIdConnectModule --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update OpenIdConnectModule --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "cryptoContextType" : {
      "title" : "OpenID Connect validation configuration type",

```

Global Operations

Resource path: `/global-config/authentication/modules/openidconnect`

Resource version: `1.0`

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action OpenIdConnectModule --global --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action OpenIdConnectModule --global --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action OpenIdConnectModule --global --actionName nextdescendents
```

read

Usage:

```
am> read OpenIdConnectModule --global
```

update

Usage:

```
am> update OpenIdConnectModule --global --body body
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{

PageNode

Realm Operations

Resource path: `/realm-config/authentication/authenticationtrees/nodes/PageNode`

Resource version: `1.0`

create

Usage:

```
am> create PageNode --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "$schema" : "http://json-schema.org/draft-04/schema#",
  "type" : "object",
  "properties" : {
    "pageHeader" : {
      "propertyOrder" : 100,
      "type" : "object",
      "title" : "Page Header",
```

```
      "description" : "Localisation overrides - as key fill shortcut for language (first will be used
as default if not empty or \"Default header\" if empty), value is header for language defined by
key",
      "exampleValue" : "",
      "patternProperties" : {
        ".*" : {
          "type" : "string"
        }
      }
    },

            "type" : "string",
            "title" : "Node ID",
            "description" : "ID of the child node"
          },
          "displayName" : {
            "type" : "string",
            "title" : "Display name",
            "description" : "The display name of the child node"
          },
          "nodeType" : {
            "type" : "string",
            "title" : "Node type",
            "description" : "The type of the child node"
          }
        }
      }
    }
  },
```

```
  "required" : [ "nodes" ]
}
```

delete

Usage:

```
am> delete PageNode --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action PageNode --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action PageNode --realm Realm --actionName getCreatableTypes
```

listOutcomes

List the available outcomes for the node type.

Usage:

```
am> action PageNode --realm Realm --body body --actionName listOutcomes
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "title" : "Some configuration of the node. This does not need to be complete against the
 configuration schema."
}
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action PageNode --realm Realm --actionName nextdescendents
```

query

Get the full list of instances of this collection. This query only supports `_queryFilter=true` filter.

Usage:

```
am> query PageNode --realm Realm --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read PageNode --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update PageNode --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "$schema" : "http://json-schema.org/draft-04/schema#",
  "type" : "object",
  "properties" : {
    "pageHeader" : {
      "propertyOrder" : 100,
      "type" : "object",
      "title" : "Page Header",
      "description" : "Localisation overrides - as key fill shortcut for language (first will be used
 as default if not empty or \"Default header\" if empty), value is header for language defined by
 key",
      "exampleValue" : "",
      "patternProperties" : {
        ".*" : {
          "type" : "string"
        }
      }
    },
    "pageDescription" : {
      "propertyOrder" : 200,
      "type" : "object",
      "title" : "Page Description",
      "description" : "Localisation overrides - as key fill shortcut for language (first will be used
 as default if not empty or \"Default description\" if empty), value is description for language
 defined by key",
      "exampleValue" : "",
      "patternProperties" : {
        ".*" : {
          "type" : "string"
        }
      }
    },
    "stage" : {
      "propertyOrder" : 300,
      "type" : "string",
      "title" : "Stage",
      "description" : "An optional stage name to pass to the client to aid in rendering"
    },
    "nodes" : {
      "propertyOrder" : 400,
      "type" : "array",
      "title" : "Page Nodes",
      "description" : "The child nodes, in the order they are returned to the authentication client",
      "items" : {
        "type" : "object",
        "title" : "Child Node",
        "description" : "A node that is used in the page",
        "properties" : {
          "id" : {
            "type" : "string",
            "title" : "Node ID",
            "description" : "ID of the child node"
          },
          "displayName" : {
            "type" : "string",
```

```
            "title" : "Display name",
            "description" : "The display name of the child node"
          },
          "nodeType" : {
            "type" : "string",
            "title" : "Node type",
            "description" : "The type of the child node"
          }
        }
      }
    }
  },
  "required" : [ "nodes" ]
}
```

PasswordCollector

Realm Operations

Resource path: `/realm-config/authentication/authenticationtrees/nodes/PasswordCollectorNode`

Resource version: `1.0`

create

Usage:

```
am> create PasswordCollector --realm Realm --id id --body body
```

Parameters:

`--id`

The unique identifier for the resource.

`--body`

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "required" : [ ]
}
```

delete

Usage:

```
am> delete PasswordCollector --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action PasswordCollector --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action PasswordCollector --realm Realm --actionName getCreatableTypes
```

listOutcomes

List the available outcomes for the node type.

Usage:

```
am> action PasswordCollector --realm Realm --body body --actionName listOutcomes
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "title" : "Some configuration of the node. This does not need to be complete against the
 configuration schema."
}
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action PasswordCollector --realm Realm --actionName nextdescendents
```

query

Get the full list of instances of this collection. This query only supports `_queryFilter=true` filter.

Usage:

```
am> query PasswordCollector --realm Realm --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read PasswordCollector --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update PasswordCollector --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "required" : [ ]
}
```

PatchObject

Realm Operations

Resource path: `/realm-config/authentication/authenticationtrees/nodes/PatchObjectNode`

Resource version: `1.0`

create

Usage:

```
am> create PatchObject --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "patchAsObject" : {
      "title" : "Patch As Object",
      "description" : "Whether the patch should be done as object or client. Defaults to false, which
 represents the oauth client.",
      "propertyOrder" : 100,
      "type" : "boolean",
      "exampleValue" : ""
    },
    "identityResource" : {
      "title" : "Identity Resource",
      "description" : "The identity resource in IDM that this node will patch. This is used to aid
 node input requirement declaration.  Must match identity resource of the current tree.",
      "propertyOrder" : 300,
      "type" : "string",
      "exampleValue" : ""
    },
    "ignoredFields" : {
      "title" : "Ignored Fields",
      "description" : "Fields from sharedState that should be ignored as part of patch. If empty, all
 fields are attempted as part of the patch.",
      "propertyOrder" : 200,
      "items" : {
        "type" : "string"
```

```
      },
      "type" : "array",
      "exampleValue" : ""
    },
    "identityAttribute" : {
      "title" : "Identity Attribute",
      "description" : "The attribute used to identify the the object in IDM.",
      "propertyOrder" : 400,
      "type" : "string",
      "exampleValue" : ""
    }
  },
  "required" : [ "identityAttribute", "ignoredFields", "identityResource", "patchAsObject" ]
}
```

delete

Usage:

```
am> delete PatchObject --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action PatchObject --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action PatchObject --realm Realm --actionName getCreatableTypes
```

listOutcomes

List the available outcomes for the node type.

Usage:

```
am> action PatchObject --realm Realm --body body --actionName listOutcomes
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "title" : "Some configuration of the node. This does not need to be complete against the
 configuration schema."
}
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action PatchObject --realm Realm --actionName nextdescendents
```

query

Get the full list of instances of this collection. This query only supports `_queryFilter=true` filter.

Usage:

```
am> query PatchObject --realm Realm --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read PatchObject --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update PatchObject --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "patchAsObject" : {
      "title" : "Patch As Object",
      "description" : "Whether the patch should be done as object or client. Defaults to false, which
 represents the oauth client.",
      "propertyOrder" : 100,
      "type" : "boolean",
      "exampleValue" : ""
    },
    "identityResource" : {
      "title" : "Identity Resource",
      "description" : "The identity resource in IDM that this node will patch. This is used to aid
 node input requirement declaration.  Must match identity resource of the current tree.",
      "propertyOrder" : 300,
      "type" : "string",
      "exampleValue" : ""
    },
    "ignoredFields" : {
      "title" : "Ignored Fields",
      "description" : "Fields from sharedState that should be ignored as part of patch. If empty, all
 fields are attempted as part of the patch.",
      "propertyOrder" : 200,
      "items" : {
        "type" : "string"
      },
      "type" : "array",
      "exampleValue" : ""
    },
    "identityAttribute" : {
      "title" : "Identity Attribute",
      "description" : "The attribute used to identify the the object in IDM.",
      "propertyOrder" : 400,
      "type" : "string",
      "exampleValue" : ""
    }
  },
  "required" : [ "identityAttribute", "ignoredFields", "identityResource", "patchAsObject" ]
```

```
}
```

PendingUmaRequests

Realm Operations

Pending UMA requests provider is responsible for allowing, denying and querying the guest requests for user resources. Awailable actions are Query, Read, Deny (all requests or one request), Approve (all requests or one request)

Resource path: `/users/{user}/uma/pendingrequests`

Resource version: `1.0`

approve

Approve the pending request and grant access to the requesting user.

Usage:

```
am> action PendingUmaRequests --realm Realm --id id --body body --user user --actionName approve
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "$schema" : "http://json-schema.org/draft-04/schema#",
  "description" : "Approve action request schema.",
  "type" : "object",
  "title" : "Approve action request schema",
  "properties" : {
    "scopes" : {
      "type" : "array",
      "title" : "Approve request scopes",
      "description" : "The list of the scopes the requesting user gets access to.",
      "items" : {
        "type" : "string"
      }
    }
  },
  "required" : [ "scopes" ]
}
```

--user

Pending UMA requests provider is responsible for allowing, denying and querying the guest requests for user resources. Available actions are Query, Read, Deny (all requests or one request), Approve (all requests or one request)

approveAll

Approve every pending requests and grant access to the requesting user.

Usage:

```
am> action PendingUmaRequests --realm Realm --body body --user user --actionName approveAll
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "$schema" : "http://json-schema.org/draft-04/schema#",
  "description" : "Approve action request schema.",
  "type" : "object",
  "title" : "Approve action request schema",
  "properties" : {
    "scopes" : {
      "type" : "array",
      "title" : "Approve request scopes",
      "description" : "The list of the scopes the requesting user gets access to.",
      "items" : {
        "type" : "string"
      }
    }
  },
  "required" : [ "scopes" ]
}
```

--user

Pending UMA requests provider is responsible for allowing, denying and querying the guest requests for user resources. Available actions are Query, Read, Deny (all requests or one request), Approve (all requests or one request)

query

Query the collection of pending requests.

Usage:

```
am> query PendingUmaRequests --realm Realm --filter filter --user user
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all. Fields that can be queried: [*]

--user

Pending UMA requests provider is responsible for allowing, denying and querying the guest requests for user resources. Available actions are Query, Read, Deny (all requests or one request), Approve (all requests or one request)

read

Read pending request

Usage:

```
am> read PendingUmaRequests --realm Realm --id id --user user
```

Parameters:

--id

The unique identifier for the resource.

--user

Pending UMA requests provider is responsible for allowing, denying and querying the guest requests for user resources. Available actions are Query, Read, Deny (all requests or one request), Approve (all requests or one request)

PersistentCookieDecision

Realm Operations

Resource path: `/realm-config/authentication/authenticationtrees/nodes/PersistentCookieDecisionNode`

Resource version: `1.0`

create

Usage:

```
am> create PersistentCookieDecision --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "useSecureCookie" : {
      "title" : "Use Secure Cookie",
      "description" : "Sets the persistent cookie as \"Secure\".",
      "propertyOrder" : 300,
      "type" : "boolean",
      "exampleValue" : ""
    },
    "useHttpOnlyCookie" : {
      "title" : "Use HTTP Only Cookie",
      "description" : "Sets the persistent cookie as \"HttpOnly\".",
      "propertyOrder" : 400,
      "type" : "boolean",
      "exampleValue" : ""
    },
    "enforceClientIp" : {
      "title" : "Enforce Client IP",
      "description" : "Enforces that the persistent cookie can only be used from the same client IP to
 which the cookie was issued.",
      "propertyOrder" : 200,
      "type" : "boolean",
      "exampleValue" : ""
    },
    "persistentCookieName" : {
      "title" : "Persistent Cookie Name",
      "description" : "The name of the persistent cookie.",
      "propertyOrder" : 600,
      "type" : "string",
      "exampleValue" : ""
    },
    "hmacSigningKey" : {
      "title" : "HMAC Signing Key",
      "description" : "Base64-encoded 256-bit key to use for HMAC signing of the cookie.",
      "propertyOrder" : 500,
      "type" : "string",
      "format" : "password",
      "exampleValue" : ""
    },
    "idleTimeout" : {
      "title" : "Idle Timeout",
      "description" : "The maximum idle time between requests before the cookie is invalidated, in
 hours.",
      "propertyOrder" : 100,
```

```
      "type" : "integer",
      "exampleValue" : ""
    }
  },
  "required" : [ "hmacSigningKey", "useHttpOnlyCookie", "idleTimeout", "persistentCookieName",
 "enforceClientIp", "useSecureCookie" ]
}
```

delete

Usage:

```
am> delete PersistentCookieDecision --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action PersistentCookieDecision --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action PersistentCookieDecision --realm Realm --actionName getCreatableTypes
```

listOutcomes

List the available outcomes for the node type.

Usage:

```
am> action PersistentCookieDecision --realm Realm --body body --actionName listOutcomes
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "title" : "Some configuration of the node. This does not need to be complete against the
 configuration schema."
}
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action PersistentCookieDecision --realm Realm --actionName nextdescendents
```

query

Get the full list of instances of this collection. This query only supports `_queryFilter=true` filter.

Usage:

```
am> query PersistentCookieDecision --realm Realm --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read PersistentCookieDecision --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update PersistentCookieDecision --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "useSecureCookie" : {
      "title" : "Use Secure Cookie",
      "description" : "Sets the persistent cookie as \"Secure\".",
      "propertyOrder" : 300,
      "type" : "boolean",
      "exampleValue" : ""
    },
    "useHttpOnlyCookie" : {
      "title" : "Use HTTP Only Cookie",
      "description" : "Sets the persistent cookie as \"HttpOnly\".",
      "propertyOrder" : 400,
      "type" : "boolean",
      "exampleValue" : ""
    },
    "enforceClientIp" : {
      "title" : "Enforce Client IP",
      "description" : "Enforces that the persistent cookie can only be used from the same client IP to
 which the cookie was issued.",
      "propertyOrder" : 200,
      "type" : "boolean",
      "exampleValue" : ""
    },
    "persistentCookieName" : {
      "title" : "Persistent Cookie Name",
      "description" : "The name of the persistent cookie.",
      "propertyOrder" : 600,
      "type" : "string",
      "exampleValue" : ""
    },
    "hmacSigningKey" : {
      "title" : "HMAC Signing Key",
      "description" : "Base64-encoded 256-bit key to use for HMAC signing of the cookie.",
      "propertyOrder" : 500,
      "type" : "string",
      "format" : "password",
      "exampleValue" : ""
    },
    "idleTimeout" : {
      "title" : "Idle Timeout",
      "description" : "The maximum idle time between requests before the cookie is invalidated, in
 hours.",
      "propertyOrder" : 100,
      "type" : "integer",
      "exampleValue" : ""
    }
```

```
  },
  "required" : [ "hmacSigningKey", "useHttpOnlyCookie", "idleTimeout", "persistentCookieName",
 "enforceClientIp", "useSecureCookie" ]
}
```

PersistentCookieModule

Realm Operations

Resource path: `/realm-config/authentication/modules/persistentcookie`

Resource version: `1.0`

create

Usage:

```
am> create PersistentCookieModule --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "cookieName" : {
      "title" : "Persistent Cookie Name",
      "description" : "Sets the name of the persistent cookie",
      "propertyOrder" : null,
      "required" : true,
      "type" : "string",
      "exampleValue" : ""
    },
    "idleTimeout" : {
      "title" : "Idle Timeout",
      "description" : "The maximum idle time between requests before the cookie is invalidated, in
 hours.",
      "propertyOrder" : 100,
      "required" : true,
      "type" : "integer",
      "exampleValue" : ""
    },
    "maxLife" : {
```

```
      "title" : "Max Life",
      "description" : "The maximum length of time the persistent cookie is valid for, in hours.",
      "propertyOrder" : 200,
      "required" : true,
      "type" : "integer",
      "exampleValue" : ""
    },
    "useSecureCookie" : {
      "title" : "Use secure cookie",
      "description" : "Sets the persistent cookie as \"Secure\"",
      "propertyOrder" : 400,
      "required" : true,
      "type" : "boolean",
      "exampleValue" : ""
    },
    "enforceClientIP" : {
      "title" : "Enforce Client IP",
      "description" : "Enforces that the persistent cookie can only be used from the same client IP to
 which the cookie was issued.",
      "propertyOrder" : 300,
      "required" : true,
      "type" : "boolean",
      "exampleValue" : ""
    },
    "useHttpOnlyCookie" : {
      "title" : "Use HTTP only cookie",
      "description" : "Sets the persistent cookie as \"HttpOnly\"",
      "propertyOrder" : 500,
      "required" : true,
      "type" : "boolean",
      "exampleValue" : ""
    }
  }
}
```

delete

Usage:

```
am> delete PersistentCookieModule --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action PersistentCookieModule --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action PersistentCookieModule --realm Realm --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action PersistentCookieModule --realm Realm --actionName nextdescendents
```

query

Get the full list of instances of this collection. This query only supports `_queryFilter=true` filter.

Usage:

```
am> query PersistentCookieModule --realm Realm --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read PersistentCookieModule --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update PersistentCookieModule --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "cookieName" : {
      "title" : "Persistent Cookie Name",
      "description" : "Sets the name of the persistent cookie",
      "propertyOrder" : null,
      "required" : true,
      "type" : "string",
      "exampleValue" : ""
    },
    "idleTimeout" : {
      "title" : "Idle Timeout",
      "description" : "The maximum idle time between requests before the cookie is invalidated, in
 hours.",
      "propertyOrder" : 100,
      "required" : true,
      "type" : "integer",
      "exampleValue" : ""
    },
    "maxLife" : {
      "title" : "Max Life",
      "description" : "The maximum length of time the persistent cookie is valid for, in hours.",
      "propertyOrder" : 200,
      "required" : true,
      "type" : "integer",
      "exampleValue" : ""
    },
    "useSecureCookie" : {
      "title" : "Use secure cookie",
      "description" : "Sets the persistent cookie as \"Secure\"",
      "propertyOrder" : 400,
      "required" : true,
      "type" : "boolean",
      "exampleValue" : ""
    },
    "enforceClientIP" : {
      "title" : "Enforce Client IP",
      "description" : "Enforces that the persistent cookie can only be used from the same client IP to
 which the cookie was issued.",
      "propertyOrder" : 300,
      "required" : true,
      "type" : "boolean",
      "exampleValue" : ""
    },
    "useHttpOnlyCookie" : {
      "title" : "Use HTTP only cookie",
      "description" : "Sets the persistent cookie as \"HttpOnly\"",
      "propertyOrder" : 500,
      "required" : true,
      "type" : "boolean",
```

```
      "exampleValue" : ""
    }
  }
}
```

Global Operations

Resource path: `/global-config/authentication/modules/persistentcookie`

Resource version: `1.0`

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action PersistentCookieModule --global --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action PersistentCookieModule --global --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action PersistentCookieModule --global --actionName nextdescendents
```

read

Usage:

```
am> read PersistentCookieModule --global
```

update

Usage:

```
am> update PersistentCookieModule --global --body body
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "defaults" : {
      "properties" : {
        "idleTimeout" : {
          "title" : "Idle Timeout",
          "description" : "The maximum idle time between requests before the cookie is invalidated, in
 hours.",
          "propertyOrder" : 100,
          "required" : true,
          "type" : "integer",
          "exampleValue" : ""
        },
        "maxLife" : {
          "title" : "Max Life",
          "description" : "The maximum length of time the persistent cookie is valid for, in hours.",
          "propertyOrder" : 200,
          "required" : true,
          "type" : "integer",
          "exampleValue" : ""
        },
        "cookieName" : {
          "title" : "Persistent Cookie Name",
          "description" : "Sets the name of the persistent cookie",
          "propertyOrder" : null,
          "required" : true,
          "type" : "string",
          "exampleValue" : ""
        },
        "useSecureCookie" : {
          "title" : "Use secure cookie",
          "description" : "Sets the persistent cookie as \"Secure\"",
          "propertyOrder" : 400,
          "required" : true,
          "type" : "boolean",
          "exampleValue" : ""
        },
        "enforceClientIP" : {
          "title" : "Enforce Client IP",
          "description" : "Enforces that the persistent cookie can only be used from the same client
 IP to which the cookie was issued.",
          "propertyOrder" : 300,
          "required" : true,
          "type" : "boolean",
          "exampleValue" : ""
        },
        "useHttpOnlyCookie" : {
          "title" : "Use HTTP only cookie",
          "description" : "Sets the persistent cookie as \"HttpOnly\"",
          "propertyOrder" : 500,
          "required" : true,
          "type" : "boolean",
```

```
          "exampleValue" : ""
        }
      },
      "type" : "object",
      "title" : "Realm Defaults"
    }
  }
}
```

Platform

Global Operations

Resource path: `/global-config/services/platform`

Resource version: `1.0`

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action Platform --global --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action Platform --global --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action Platform --global --actionName nextdescendents
```

read

Usage:

```
am> read Platform --global
```

update

Usage:

```
am> update Platform --global --body body
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "cookieDomains" : {
      "title" : "Cookie Domains",
      "description" : "Set the list of domains into which OpenAM writes cookies.<br><br>If you set
 multiple cookie domains, OpenAM still only sets the cookie in the domain the client uses to access
 OpenAM. If this property is left blank, then the fully qualified domain name of the server is used to
 set the cookie domain, meaning that a host cookie rather than a domain cookie is set.",
      "propertyOrder" : 200,
      "required" : true,
      "items" : {
        "type" : "string"
      },
      "type" : "array",
      "exampleValue" : ""
    },
    "locale" : {
      "title" : "Platform Locale",
      "description" : "Set the fallback locale used when the user locale cannot be determined.",
      "propertyOrder" : 100,
      "required" : true,
      "type" : "string",
      "exampleValue" : ""
    }
  }
}
```

PlatformPassword

Realm Operations

Resource path: `/realm-config/authentication/authenticationtrees/nodes/ValidatedPasswordNode`

Resource version: `1.0`

create

Usage:

```
am> create PlatformPassword --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "validateInput" : {
      "title" : "Validate password",
      "description" : "Check IDM policy against this password and return any policy failures as
 errors.",
      "propertyOrder" : 100,
      "type" : "boolean",
      "exampleValue" : ""
    },
    "passwordAttribute" : {
      "title" : "Password Attribute",
      "description" : "The name of the attribute in the IDM object that stores the password.",
      "propertyOrder" : 200,
      "type" : "string",
      "exampleValue" : ""
    }
  },
  "required" : [ "validateInput", "passwordAttribute" ]
}
```

delete

Usage:

```
am> delete PlatformPassword --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action PlatformPassword --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action PlatformPassword --realm Realm --actionName getCreatableTypes
```

listOutcomes

List the available outcomes for the node type.

Usage:

```
am> action PlatformPassword --realm Realm --body body --actionName listOutcomes
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "title" : "Some configuration of the node. This does not need to be complete against the
 configuration schema."
}
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action PlatformPassword --realm Realm --actionName nextdescendents
```

query

Get the full list of instances of this collection. This query only supports `_queryFilter=true` filter.

Usage:

```
am> query PlatformPassword --realm Realm --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read PlatformPassword --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update PlatformPassword --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "validateInput" : {
      "title" : "Validate password",
      "description" : "Check IDM policy against this password and return any policy failures as
 errors.",
      "propertyOrder" : 100,
      "type" : "boolean",
      "exampleValue" : ""
    },
    "passwordAttribute" : {
      "title" : "Password Attribute",
      "description" : "The name of the attribute in the IDM object that stores the password.",
      "propertyOrder" : 200,
      "type" : "string",
      "exampleValue" : ""
    }
  },
  "required" : [ "validateInput", "passwordAttribute" ]
}
```

PlatformUsername

Realm Operations

Resource path: `/realm-config/authentication/authenticationtrees/nodes/ValidatedUsernameNode`

Resource version: `1.0`

create

Usage:

```
am> create PlatformUsername --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "validateInput" : {
      "title" : "Validate username",
      "description" : "Check IDM policy against this username and return any policy failures as
 errors.",
      "propertyOrder" : 100,
      "type" : "boolean",
      "exampleValue" : ""
    },
    "usernameAttribute" : {
      "title" : "Username Attribute",
      "description" : "The name of the attribute in the IDM object that stores the username.",
      "propertyOrder" : 200,
      "type" : "string",
      "exampleValue" : ""
    }
  },
  "required" : [ "usernameAttribute", "validateInput" ]
}
```

delete

Usage:

```
am> delete PlatformUsername --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action PlatformUsername --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action PlatformUsername --realm Realm --actionName getCreatableTypes
```

listOutcomes

List the available outcomes for the node type.

Usage:

```
am> action PlatformUsername --realm Realm --body body --actionName listOutcomes
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "title" : "Some configuration of the node. This does not need to be complete against the
 configuration schema."
}
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action PlatformUsername --realm Realm --actionName nextdescendents
```

query

Get the full list of instances of this collection. This query only supports `_queryFilter=true` filter.

Usage:

```
am> query PlatformUsername --realm Realm --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read PlatformUsername --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update PlatformUsername --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "validateInput" : {
      "title" : "Validate username",
      "description" : "Check IDM policy against this username and return any policy failures as
 errors.",
      "propertyOrder" : 100,
      "type" : "boolean",
      "exampleValue" : ""
    },
    "usernameAttribute" : {
      "title" : "Username Attribute",
      "description" : "The name of the attribute in the IDM object that stores the username.",
      "propertyOrder" : 200,
      "type" : "string",
      "exampleValue" : ""
    }
  },
  "required" : [ "usernameAttribute", "validateInput" ]
}
```

Policies

Realm Operations

The Policy resource with copy and move support endpoint is responsible for managing policies. It supports all the operations that previous version of Policy resource endpoint supports - create, read, update, delete, query, evalute and evaluateTree action - with two new actions move and copy for copying and moving policies between realms

Resource path: `/policies`

Resource version: `2.1`

copy

Copy a list of policies

Usage:

```
am> action Policies --realm Realm --body body --actionName copy
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "$schema" : "http://json-schema.org/draft-04/schema#",
  "description" : "Policy copy action schema",
  "type" : "object",
  "title" : "Policy copy action schema",
  "properties" : {
    "from" : {
      "title" : "Copy/move from",
      "description" : "Policy copy/move origin parameters",
      "type" : "object",
      "properties" : {
        "application" : {
          "title" : "Application",
          "description" : "The policy set in which the input policies are located",
          "type" : "string"
        }
      },
      "required" : [ "application" ]
    },
    "to" : {
      "type" : "object",
      "title" : "Copy/Move To",
      "description" : "Policy copy/move destination parameters",
      "properties" : {
        "application" : {
          "title" : "Application",
```

```
          "description" : "The policy set in which to place the output policy. Required when copying
 or moving a policy to a different policy set.",
          "type" : "string"
        },
        "realm" : {
          "title" : "Realm",
          "description" : "The realm in which to place the output policy. If not specified, OpenAM
 copies or moves the policy within the realm identified in the URL. Required when copying or moving a
 policy to a different realm.",
          "type" : "string"
        },
        "namePostfix" : {
          "title" : "Name postfix",
          "description" : "A value appended to output policy names in order to prevent name clashes",
          "type" : "string"
        }
      },
      "required" : [ "namePostfix" ]
    },
    "resourceTypeMapping" : {
      "title" : "Resource type mapping",
      "description" : "One or more resource types mappings, where the left side of the mapping
 specifies the UUID of a resource type used by the input policies and the right side of the mapping
 specifies the UUID of a resource type used by the output policies. The two resource types should have
 the same resource patterns",
      "type" : "object",
      "additionalProperties" : {
        "type" : "string"
      }
    }
  },
  "required" : [ "from", "to" ]
}
```

create

Create new policy

Usage:

```
am> create Policies --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "$schema" : "http://json-schema.org/draft-04/schema#",
  "description" : "Json schema for the policy resource",
  "title" : "Policy Resource Schema",
  "type" : "object",
```

```
 "properties" : {
   "name" : {
     "title" : "Name",
     "description" : "String matching the name of the application",
     "type" : "string"
   },
   "active" : {
     "title" : "Active flag",
     "description" : "Boolean indicating whether OpenAM considers the policy active for evaluation
purposes, defaults to false",
     "type" : "boolean"
   },
   "description" : {
     "title" : "Description",
     "description" : "String describing the policy",
     "type" : "string"
   },
   "applicationName" : {
     "title" : "Application name",
     "description" : "String containing the application name, such as \"iPlanetAMWebAgentService\",
or \"mypolicyset\"",
     "type" : "string"
   },
   "actionValues" : {
     "title" : "Action values",
     "description" : "Set of string action names, each set to a boolean indicating whether the action
is allowed. Chosen from the available actions provided by the associated Managing Resource Types
resource type",
     "type" : "object",
     "additionalProperties" : {
       "type" : "boolean"
     }
   },
   "resources" : {
     "title" : "Resources",
     "description" : "List of the resource name pattern strings to which the policy applies. Must
conform to the pattern templates provided by the associated Managing Resource Types resource type",
     "type" : "array",
     "items" : {
       "type" : "string"
     }
   },
   "subject" : {
     "title" : "Subject",
     "description" : "Specifies the subject conditions to which the policy applies, where subjects
can be combined by using the built-in types \"AND\", \"OR\", and \"NOT\", and where subject
implementations are pluggable",
     "type" : "object"
   },
   "condition" : {
     "title" : "Condition",
     "description" : "Specifies environment conditions, where conditions can be combined by using the
built-in types \"AND\", \"OR\", and \"NOT\", and where condition implementations are pluggable",
     "type" : "object",
     "properties" : {
       "type" : {
         "type" : "string"
       },
       "conditions" : {
```

```
          "type" : "array",
          "title" : "Condition",
          "description" : "Specifies environment conditions, where conditions can be combined by using
 the built-in types \"AND\", \"OR\", and \"NOT\", and where condition implementations are pluggable",
          "items" : {
            "type" : "object"
          }
        }
      }
    },
    "resourceTypeUuid" : {
      "title" : "Resource Type UUID",
      "description" : "The UUIDs of the resource type associated with the policy",
      "type" : "string"
    },
    "resourceAttributes" : {
      "title" : "Resource Attributes",
      "description" : "List of attributes to return with decisions. These attributes are known as
 response attributes",
      "type" : "array",
      "items" : {
        "type" : "object"
      }
    },
    "lastModifiedBy" : {
      "title" : "Last Modified By",
      "description" : "A string containing the universal identifier DN of the subject that most
 recently updated the policy",
      "type" : "string"
    },
    "lastModifiedDate" : {
      "title" : "Last Modified date",
      "description" : "An integer containing the last modified date and time, in number of seconds",
      "type" : "string"
    },
    "createdBy" : {
      "title" : "Created By",
      "description" : "A string containing the universal identifier DN of the subject that created the
 policy",
      "type" : "string"
    },
    "creationDate" : {
      "title" : "Creation Date",
      "description" : "An integer containing the creation date and time, in number of seconds",
      "type" : "string"
    }
  }
}
```

delete

Delete policy

Usage:

```
am> delete Policies --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

evaluate

Request policy decisions for specific resources

Usage:

```
am> action Policies --realm Realm --body body --actionName evaluate
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "$schema" : "http://json-schema.org/draft-04/schema#",
  "description" : "Evaluate action schema",
  "title" : "Evaluate action schema",
  "type" : "object",
  "properties" : {
    "resources" : {
      "type" : "array",
      "title" : "Resources",
      "description" : "Specifies the list of resources for which to return decisions",
      "items" : {
        "type" : "string"
      }
    },
    "application" : {
      "title" : "Application",
      "description" : "Holds the name of the application, and defaults to \"iPlanetAMWebAgentService\"
 if not specified",
      "type" : "string"
    },
    "subject" : {
      "title" : "Subject",
      "description" : "Holds an object that represents the subject. You can specify one or more of the
 following keys. If you specify multiple keys, the subject can have multiple associated principals,
 and you can use subject conditions corresponding to any type in the request",
      "type" : "object",
      "properties" : {
        "ssoToken" : {
          "title" : "SSOToken",
          "description" : "The value is the SSO token ID string for the subject",
          "type" : "string"
        },
        "jwt" : {
          "title" : "JWT",
          "description" : "The value is a JWT string",
          "type" : "string"
        },
```

```
        "claims" : {
          "title" : "Claims",
          "description" : "The value is an object (map) of JWT claims to their values.",

          "type" : "string"
        }
      }
    }
  },
  "required" : [ "resources", "application" ]
}
```

evaluateTree

Request policy decisions for a tree of resources

Usage:

```
am> action Policies --realm Realm --body body --actionName evaluateTree
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "$schema" : "http://json-schema.org/draft-04/schema#",
  "description" : "Evaluate tree action schema",
  "title" : "Evaluate tree action schema",
  "type" : "object",
  "properties" : {
    "resource" : {
      "title" : "Resource",
      "description" : "Specifies the root resource for the decisions to return",
      "type" : "string"
    },
    "application" : {
      "title" : "Application",
      "description" : "Holds the name of the application, and defaults to \"iPlanetAMWebAgentService\"
 if not specified",
      "type" : "string"
    },
    "subject" : {
```

```
      "title" : "Subject",
      "description" : "Holds an object that represents the subject. You can specify one or more of the
 following keys. If you specify multiple keys, the subject can have multiple associated principals,
 and you can use subject conditions corresponding to any type in the request",
      "type" : "object",
      "properties" : {
        "ssoToken" : {
          "title" : "SSOToken",
          "description" : "The value is the SSO token ID string for the subject",
          "type" : "string"
        },
        "jwt" : {
          "title" : "JWT",
          "description" : "The value is a JWT string",
          "type" : "string"
        },
        "claims" : {
          "title" : "Claims",
          "description" : "The value is an object (map) of JWT claims to their values.",
          "type" : "object",
          "additionalProperties" : {
            "type" : "string"
          }
        }
      }
    },
    "environment" : {
      "title" : "Environment",
      "description" : "Holds a map of keys to lists of values",
      "type" : "object",
      "additionalProperties" : {
        "type" : "array",
        "items" : {
          "type" : "string"
        }
      }
    }
  },
  "required" : [ "resources", "application" ]
}
```

move

Move a list of policies

Usage:

```
am> action Policies --realm Realm --body body --actionName move
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "$schema" : "http://json-schema.org/draft-04/schema#",
```

```
  "description" : "Policy copy action schema",
  "type" : "object",
  "title" : "Policy copy action schema",
  "properties" : {
    "from" : {
      "title" : "Copy/move from",
      "description" : "Policy copy/move origin parameters",
      "type" : "object",
      "properties" : {
        "application" : {
          "title" : "Application",
          "description" : "The policy set in which the input policies are located",
          "type" : "string"
        }
      },
      "required" : [ "application" ]
    },
    "to" : {
      "type" : "object",
      "title" : "Copy/Move To",
      "description" : "Policy copy/move destination parameters",
      "properties" : {
        "application" : {
          "title" : "Application",
          "description" : "The policy set in which to place the output policy. Required when copying
 or moving a policy to a different policy set.",
          "type" : "string"
        },
        "realm" : {
          "title" : "Realm",
          "description" : "The realm in which to place the output policy. If not specified, OpenAM
 copies or moves the policy within the realm identified in the URL. Required when copying or moving a
 policy to a different realm.",
          "type" : "string"
        },
        "namePostfix" : {
          "title" : "Name postfix",
          "description" : "A value appended to output policy names in order to prevent name clashes",
          "type" : "string"
        }
      },
      "required" : [ "namePostfix" ]
    },
    "resourceTypeMapping" : {
      "title" : "Resource type mapping",
      "description" : "One or more resource types mappings, where the left side of the mapping
 specifies the UUID of a resource type used by the input policies and the right side of the mapping
 specifies the UUID of a resource type used by the output policies. The two resource types should have
 the same resource patterns",
      "type" : "object",
      "additionalProperties" : {
        "type" : "string"
      }
    }
  },
  "required" : [ "from", "to" ]
}
```

query

Query the stored policies

Usage:

```
am> query Policies --realm Realm --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all. Fields that can be queried: [*]

read

Read policy

Usage:

```
am> read Policies --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Update an existing policy

Usage:

```
am> update Policies --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "$schema" : "http://json-schema.org/draft-04/schema#",
  "description" : "Json schema for the policy resource",
  "title" : "Policy Resource Schema",
  "type" : "object",
  "properties" : {
    "name" : {
      "title" : "Name",
      "description" : "String matching the name of the application",
```

```
      "type" : "string"
    },
    "active" : {
      "title" : "Active flag",
      "description" : "Boolean indicating whether OpenAM considers the policy active for evaluation
purposes, defaults to false",
      "type" : "boolean"
    },
    "description" : {
      "title" : "Description",
      "description" : "String describing the policy",
      "type" : "string"
    },
    "applicationName" : {
      "title" : "Application name",
      "description" : "String containing the application name, such as \"iPlanetAMWebAgentService\",
or \"mypolicyset\"",
      "type" : "string"
    },
    "actionValues" : {
      "title" : "Action values",
      "description" : "Set of string action names, each set to a boolean indicating whether the action
is allowed. Chosen from the available actions provided by the associated Managing Resource Types
resource type",
      "type" : "object",
      "additionalProperties" : {
        "type" : "boolean"
      }
    },
    "resources" : {
      "title" : "Resources",
      "description" : "List of the resource name pattern strings to which the policy applies. Must
conform to the pattern templates provided by the associated Managing Resource Types resource type",
      "type" : "array",
      "items" : {
        "type" : "string"
      }
    },
    "subject" : {
      "title" : "Subject",
      "description" : "Specifies the subject conditions to which the policy applies, where subjects
can be combined by using the built-in types \"AND\", \"OR\", and \"NOT\", and where subject
implementations are pluggable",
      "type" : "object"
    },
    "condition" : {
      "title" : "Condition",
      "description" : "Specifies environment conditions, where conditions can be combined by using the
built-in types \"AND\", \"OR\", and \"NOT\", and where condition implementations are pluggable",
      "type" : "object",
      "properties" : {
        "type" : {
          "type" : "string"
        },

    }
  }
}
```

PolicyAgents

Realm Operations

Agents handler that is responsible for managing agents

Resource path: `/realm-config/agents/2.2_Agent`

Resource version: `1.0`

create

Usage:

```
am> create PolicyAgents --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "cdssoRootUrl" : {
      "title" : "Agent Key Value(s)",
      "description" : "Set the agent properties with a key/value pair. This property is used by AM to
 receive agent requests for credential assertions about users. Currently, only one property is valid
 and all other properties will be ignored. Use the following format: <br> agentRootURL=protocol://
hostname:port/ <br> The entry must be precise and agentRootURL is case sensitive.",
      "propertyOrder" : 22500,
      "items" : {
        "type" : "string"
      },
      "type" : "object",
      "exampleValue" : "",
      "properties" : {
        "inherited" : {
          "type" : "boolean",
          "required" : true
        },
        "value" : {
          "type" : "array",
          "required" : true
        }
      }
    },
    "userpassword" : {
      "title" : "Password",
      "description" : "",
      "propertyOrder" : 100,
      "required" : true,
      "type" : "string",
      "format" : "password",
      "exampleValue" : ""
    },
    "status" : {
      "title" : "Status",
      "description" : "Status of the agent configuration.",
      "propertyOrder" : 200,
      "type" : "object",
      "exampleValue" : "",
      "properties" : {
```

```
        "inherited" : {
          "type" : "boolean",
          "required" : true
        },
        "value" : {
          "type" : "string",
          "required" : true
        }
      }
    },
    "description" : {
      "title" : "Description",
      "description" : "",
      "propertyOrder" : 22400,
      "type" : "object",
      "exampleValue" : "",
      "properties" : {
        "inherited" : {
          "type" : "boolean",
          "required" : true
        },
        "value" : {
          "type" : "string",
          "required" : true
        }
      }
    }
  }
}
```

delete

Usage:

```
am> delete PolicyAgents --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action PolicyAgents --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action PolicyAgents --realm Realm --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action PolicyAgents --realm Realm --actionName nextdescendents
```

query

Querying the agents of a specific type

Usage:

```
am> query PolicyAgents --realm Realm --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read PolicyAgents --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update PolicyAgents --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "cdssoRootUrl" : {
      "title" : "Agent Key Value(s)",
      "description" : "Set the agent properties with a key/value pair. This property is used by AM to
 receive agent requests for credential assertions about users. Currently, only one property is valid
 and all other properties will be ignored. Use the following format: <br> agentRootURL=protocol://
hostname:port/ <br> The entry must be precise and agentRootURL is case sensitive.",
      "propertyOrder" : 22500,
      "items" : {
        "type" : "string"
      },
      "type" : "object",
      "exampleValue" : "",
      "properties" : {
        "inherited" : {
          "type" : "boolean",
          "required" : true
        },
        "value" : {
          "type" : "array",
          "required" : true
        }
      }
    },
    "userpassword" : {
      "title" : "Password",
      "description" : "",
      "propertyOrder" : 100,
      "required" : true,
      "type" : "string",
      "format" : "password",
      "exampleValue" : ""
    },
    "status" : {
      "title" : "Status",
      "description" : "Status of the agent configuration.",
      "propertyOrder" : 200,
      "type" : "object",
      "exampleValue" : "",
      "properties" : {
        "inherited" : {
          "type" : "boolean",
          "required" : true
        },
        "value" : {
          "type" : "string",
          "required" : true
        }
      }
    },
    "description" : {
      "title" : "Description",
      "description" : "",
```

```
      "propertyOrder" : 22400,
      "type" : "object",
      "exampleValue" : "",
      "properties" : {
        "inherited" : {
          "type" : "boolean",
          "required" : true
        },
        "value" : {
          "type" : "string",
          "required" : true
        }
      }
    }
  }
}
```

PolicyConfiguration

Realm Operations

Resource path: `/realm-config/services/policyconfiguration`

Resource version: `1.0`

create

Usage:

```
am> create PolicyConfiguration --realm Realm --body body
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "maximumSearchResults" : {
      "title" : "Maximum Results Returned from Search",
      "description" : "Search limit for LDAP searches.",
      "propertyOrder" : 1400,
      "required" : true,
      "type" : "integer",
      "exampleValue" : ""
    },
    "usersSearchAttribute" : {
      "title" : "LDAP Users Search Attribute",
      "description" : "Naming attribute for user entries.",
```

```
      "propertyOrder" : 1300,

}
```

delete

Usage:

```
am> delete PolicyConfiguration --realm Realm
```

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action PolicyConfiguration --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action PolicyConfiguration --realm Realm --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action PolicyConfiguration --realm Realm --actionName nextdescendents
```

read

Usage:

```
am> read PolicyConfiguration --realm Realm
```

update

Usage:

```
am> update PolicyConfiguration --realm Realm --body body
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",

```

Global Operations

Resource path: `/global-config/services/policyconfiguration`

Resource version: `1.0`

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action PolicyConfiguration --global --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action PolicyConfiguration --global --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action PolicyConfiguration --global --actionName nextdescendents
```

read

Usage:

```
am> read PolicyConfiguration --global
```

update

Usage:

```
am> update PolicyConfiguration --global --body body
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{

PollingWaitNode

Realm Operations

Resource path: `/realm-config/authentication/authenticationtrees/nodes/PollingWaitNode`

Resource version: `1.0`

create

Usage:

```
am> create PollingWaitNode --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "exitable" : {
      "title" : "Exitable",
      "description" : "Choose whether to display a link which allows the user to leave the node early.
 Creates a new outcome.",
      "propertyOrder" : 500,
      "type" : "boolean",
      "exampleValue" : ""
    },
    "spamDetectionEnabled" : {
      "title" : "Enable Spam Detection",
      "description" : "Choose whether spam detection is enforced for this node. Creates a new
 outcome.",
      "propertyOrder" : 200,
      "type" : "boolean",
      "exampleValue" : ""
    },
    "secondsToWait" : {
      "title" : "Seconds To Wait",
```

```
      "description" : "How many seconds to wait before proceeding to the next node in the tree.",
      "propertyOrder" : 100,
      "type" : "integer",
      "exampleValue" : ""
    },
    "exitMessage" : {
      "title" : "Exit Message",
      "description" : "Localisation overrides for the exit message. The whole string will be displayed
 as a link. This is a map of locale to message.",
      "propertyOrder" : 600,
      "patternProperties" : {
        ".*" : {
          "type" : "string"
        }
      },
      "type" : "object",
      "exampleValue" : ""
    },
    "waitingMessage" : {
      "title" : "Waiting Message",
      "description" : "Localisation overrides for the waiting message. May use {{time}} to get the
 number of seconds remaining. This is a map of locale to message.",
      "propertyOrder" : 400,
      "patternProperties" : {
        ".*" : {
          "type" : "string"
        }
      },
      "type" : "object",
      "exampleValue" : ""
    },

    }
  },
  "required" : [ "waitingMessage", "spamDetectionTolerance", "exitMessage", "spamDetectionEnabled",
 "exitable", "secondsToWait" ]
}
```

delete

Usage:

```
am> delete PollingWaitNode --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action PollingWaitNode --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action PollingWaitNode --realm Realm --actionName getCreatableTypes
```

listOutcomes

List the available outcomes for the node type.

Usage:

```
am> action PollingWaitNode --realm Realm --body body --actionName listOutcomes
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "title" : "Some configuration of the node. This does not need to be complete against the
 configuration schema."
}
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action PollingWaitNode --realm Realm --actionName nextdescendents
```

query

Get the full list of instances of this collection. This query only supports `_queryFilter=true` filter.

Usage:

```
am> query PollingWaitNode --realm Realm --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read PollingWaitNode --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update PollingWaitNode --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "exitable" : {
      "title" : "Exitable",
      "description" : "Choose whether to display a link which allows the user to leave the node early.
 Creates a new outcome.",
      "propertyOrder" : 500,
      "type" : "boolean",
      "exampleValue" : ""
    },
    "spamDetectionEnabled" : {
      "title" : "Enable Spam Detection",
      "description" : "Choose whether spam detection is enforced for this node. Creates a new
 outcome.",
      "propertyOrder" : 200,
      "type" : "boolean",
      "exampleValue" : ""
    },
```

```
    "secondsToWait" : {
      "title" : "Seconds To Wait",
      "description" : "How many seconds to wait before proceeding to the next node in the tree.",
      "propertyOrder" : 100,
      "type" : "integer",
      "exampleValue" : ""
    },
    "exitMessage" : {
      "title" : "Exit Message",
      "description" : "Localisation overrides for the exit message. The whole string will be displayed
 as a link. This is a map of locale to message.",
      "propertyOrder" : 600,
      "patternProperties" : {
        ".*" : {
          "type" : "string"
        }
      },
      "type" : "object",
      "exampleValue" : ""
    },
    "waitingMessage" : {
      "title" : "Waiting Message",
      "description" : "Localisation overrides for the waiting message. May use {{time}} to get the
 number of seconds remaining. This is a map of locale to message.",
      "propertyOrder" : 400,
      "patternProperties" : {
        ".*" : {
          "type" : "string"
        }
      },
      "type" : "object",
      "exampleValue" : ""
    },
    "spamDetectionTolerance" : {
      "title" : "Spam Tolerance",
      "description" : "How many times a user may resubmit to this node before the authentication is
 failed.",
      "propertyOrder" : 300,
      "type" : "integer",
      "exampleValue" : ""
    }
  },
  "required" : [ "waitingMessage", "spamDetectionTolerance", "exitMessage", "spamDetectionEnabled",
 "exitable", "secondsToWait" ]
}
```

ProfileCompletenessDecision

Realm Operations

Resource path: `/realm-config/authentication/authenticationtrees/nodes/ProfileCompletenessDecisionNode`

Resource version: `1.0`

create

Usage:

```
am> create ProfileCompletenessDecision --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "identityAttribute" : {
      "title" : "Identity Attribute",
      "description" : "The attribute to query for the IDM object.",
      "propertyOrder" : 300,
      "type" : "string",
      "exampleValue" : ""
    },
    "threshold" : {
      "title" : "Profile Completeness Threshold",
      "description" : "Percentage of user-viewable and user-editable fields that must contain a value.
 Must be in the range of [0, 100].",
      "propertyOrder" : 100,
      "type" : "integer",
      "exampleValue" : ""
    }
  },
  "required" : [ "threshold", "identityAttribute" ]
}
```

delete

Usage:

```
am> delete ProfileCompletenessDecision --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action ProfileCompletenessDecision --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action ProfileCompletenessDecision --realm Realm --actionName getCreatableTypes
```

listOutcomes

List the available outcomes for the node type.

Usage:

```
am> action ProfileCompletenessDecision --realm Realm --body body --actionName listOutcomes
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "title" : "Some configuration of the node. This does not need to be complete against the
 configuration schema."
}
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action ProfileCompletenessDecision --realm Realm --actionName nextdescendents
```

query

Get the full list of instances of this collection. This query only supports `_queryFilter=true` filter.

Usage:

```
am> query ProfileCompletenessDecision --realm Realm --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read ProfileCompletenessDecision --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update ProfileCompletenessDecision --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "identityAttribute" : {
      "title" : "Identity Attribute",
      "description" : "The attribute to query for the IDM object.",
      "propertyOrder" : 300,
      "type" : "string",
      "exampleValue" : ""
    },
    "threshold" : {
      "title" : "Profile Completeness Threshold",
      "description" : "Percentage of user-viewable and user-editable fields that must contain a value.
 Must be in the range of [0, 100].",
      "propertyOrder" : 100,
      "type" : "integer",
      "exampleValue" : ""
    }
  },
  "required" : [ "threshold", "identityAttribute" ]
}
```

PrometheusReporter

Global Operations

Resource path: `/global-config/services/monitoring/prometheus`

Resource version: `1.0`

create

Usage:

```
am> create PrometheusReporter --global --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "authenticationType" : {
      "title" : "Authentication Type",
      "description" : "",
      "propertyOrder" : 150,
      "required" : true,
      "type" : "string",
      "exampleValue" : ""
    },
    "password" : {
      "title" : "Password",
      "description" : "",
      "propertyOrder" : 300,
      "required" : true,
      "type" : "string",
      "format" : "password",
      "exampleValue" : ""
    },
    "username" : {
      "title" : "Username",
      "description" : "",
      "propertyOrder" : 200,
      "required" : true,
      "type" : "string",
```

```
      "exampleValue" : ""
    },
    "enabled" : {
      "title" : "Enabled",
      "description" : "",
      "propertyOrder" : 100,
      "required" : true,
      "type" : "boolean",
      "exampleValue" : ""
    }
  }
}
```

delete

Usage:

```
am> delete PrometheusReporter --global --id id
```

Parameters:

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action PrometheusReporter --global --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action PrometheusReporter --global --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action PrometheusReporter --global --actionName nextdescendents
```

query

Get the full list of instances of this collection. This query only supports `_queryFilter=true` filter.

Usage:

```
am> query PrometheusReporter --global --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read PrometheusReporter --global --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update PrometheusReporter --global --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "authenticationType" : {
      "title" : "Authentication Type",
      "description" : "",
      "propertyOrder" : 150,
      "required" : true,
      "type" : "string",
```

```
      "exampleValue" : ""
    },
    "password" : {
      "title" : "Password",
      "description" : "",
      "propertyOrder" : 300,
      "required" : true,
      "type" : "string",
      "format" : "password",
      "exampleValue" : ""
    },
    "username" : {
      "title" : "Username",
      "description" : "",
      "propertyOrder" : 200,
      "required" : true,
      "type" : "string",
      "exampleValue" : ""
    },
    "enabled" : {
      "title" : "Enabled",
      "description" : "",
      "propertyOrder" : 100,
      "required" : true,
      "type" : "boolean",
      "exampleValue" : ""
    }
  }
}
```

ProvisionDynamicAccount

Realm Operations

Resource path: `/realm-config/authentication/authenticationtrees/nodes/ProvisionDynamicAccountNode`

Resource version: `1.0`

create

Usage:

```
am> create ProvisionDynamicAccount --realm Realm --id id --body body
```

Parameters:

`--id`

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "accountProviderClass" : {
      "title" : "Account Provider Class",
      "description" : "",
      "propertyOrder" : 100,
      "type" : "string",
      "exampleValue" : ""
    }
  },
  "required" : [ "accountProviderClass" ]
}
```

delete

Usage:

```
am> delete ProvisionDynamicAccount --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action ProvisionDynamicAccount --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action ProvisionDynamicAccount --realm Realm --actionName getCreatableTypes
```

listOutcomes

List the available outcomes for the node type.

Usage:

```
am> action ProvisionDynamicAccount --realm Realm --body body --actionName listOutcomes
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "title" : "Some configuration of the node. This does not need to be complete against the
 configuration schema."
}
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action ProvisionDynamicAccount --realm Realm --actionName nextdescendents
```

query

Get the full list of instances of this collection. This query only supports `_queryFilter=true` filter.

Usage:

```
am> query ProvisionDynamicAccount --realm Realm --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read ProvisionDynamicAccount --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update ProvisionDynamicAccount --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "accountProviderClass" : {
      "title" : "Account Provider Class",
      "description" : "",
      "propertyOrder" : 100,
      "type" : "string",
      "exampleValue" : ""
    }
  },
  "required" : [ "accountProviderClass" ]
}
```

ProvisionIDMAccount

Realm Operations

Resource path: `/realm-config/authentication/authenticationtrees/nodes/ProvisionIdmAccountNode`

Resource version: `1.0`

create

Usage:

```
am> create ProvisionIDMAccount --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "accountProviderClass" : {
      "title" : "Account Provider Class",
      "description" : "",
      "propertyOrder" : 100,
      "type" : "string",
      "exampleValue" : ""
    }
  },
  "required" : [ "accountProviderClass" ]
}
```

delete

Usage:

```
am> delete ProvisionIDMAccount --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action ProvisionIDMAccount --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action ProvisionIDMAccount --realm Realm --actionName getCreatableTypes
```

listOutcomes

List the available outcomes for the node type.

Usage:

```
am> action ProvisionIDMAccount --realm Realm --body body --actionName listOutcomes
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "title" : "Some configuration of the node. This does not need to be complete against the
 configuration schema."
}
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action ProvisionIDMAccount --realm Realm --actionName nextdescendents
```

query

Get the full list of instances of this collection. This query only supports `_queryFilter=true` filter.

Usage:

```
am> query ProvisionIDMAccount --realm Realm --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read ProvisionIDMAccount --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update ProvisionIDMAccount --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "accountProviderClass" : {
      "title" : "Account Provider Class",
      "description" : "",
      "propertyOrder" : 100,
      "type" : "string",
      "exampleValue" : ""
    }
  },
  "required" : [ "accountProviderClass" ]
}
```

PushNotification

Realm Operations

Resource path: `/realm-config/services/pushNotification`

Resource version: `1.0`

create

Usage:

```
am> create PushNotification --realm Realm --body body
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "delegateFactory" : {
      "title" : "Message Transport Delegate Factory",
      "description" : "The fully qualified class name of the factory
 responsible for creating the PushNotificationDelegate. The class must implement
 <code>org.forgerock.openam.services.push.PushNotificationDelegate</code>.",
      "propertyOrder" : 600,
      "required" : true,
      "type" : "string",

}
```

delete

Usage:

```
am> delete PushNotification --realm Realm
```

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action PushNotification --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action PushNotification --realm Realm --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action PushNotification --realm Realm --actionName nextdescendents
```

read

Usage:

```
am> read PushNotification --realm Realm
```

update

Usage:

```
am> update PushNotification --realm Realm --body body
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "delegateFactory" : {

}
```

Global Operations

Resource path: `/global-config/services/pushNotification`

Resource version: `1.0`

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action PushNotification --global --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action PushNotification --global --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action PushNotification --global --actionName nextdescendents
```

read

Usage:

```
am> read PushNotification --global
```

update

Usage:

```
am> update PushNotification --global --body body
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "defaults" : {
      "properties" : {
        "mdCacheSize" : {
          "title" : "Response Cache Size",

```

PushNotificationResponse

Realm Operations

Push Authentication depends on the secure verification of information sent from the server to the client, and from the client to the server. This allows the server to verify that the notification was received by the original device, and for the device to verify that only the server sent out the original request. This endpoint provides the place for the device to return responses to the server to requests received either by QR code or by push notification.

Resource path: `/push/sns/message`

Resource version: `1.0`

authenticate

Message sent from device to server in response to a request for authentication sent to the device via Push notification. This message is generally sent from the ForgeRock Authenticator app.

Usage:

```
am> action PushNotificationResponse --realm Realm --body body --actionName authenticate
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "messageId" : {
      "type" : "string",
      "title" : "Message ID",
      "description" : "Unique message identifier"
    },
    "jwt" : {
      "type" : "string",
      "title" : "JWT",
      "description" : "Signed JWT containing claims:\n* `response`: Response to challenge (Base64
 encoding of the HmacSHA256 hashing of the decoded shared secret and the decoded challenge)\n* `deny`:
 Indication that this auth attempt should be shut down (boolean)"
    }
  },
  "required" : [ "messageId", "jwt" ]
}
```

register

Message sent from device to server in response to a registration message received on the device via a QR code. This message is generally sent from the ForgeRock Authenticator app.

Usage:

```
am> action PushNotificationResponse --realm Realm --body body --actionName register
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "messageId" : {
      "type" : "string",
      "title" : "Message ID",
      "description" : "Unique message identifier"
    },
    "jwt" : {
      "type" : "string",
      "title" : "JWT",
      "description" : "Signed JWT containing claims:\n* `response`: Response to challenge (Base64
 encoding of the HmacSHA256 hashing of the decoded shared secret and the decoded challenge)\n*
 `mechanismUid`: The device-specific identifier for the just-registered mechanism (string)\n*
 `deviceId`: The registration token used by GCM or APNS (string)\n* `deviceType`: `android` or `ios`
 (string)\n* `communicationType`: `gcm` or `apns` (string)"
    }
  },
  "required" : [ "messageId", "jwt" ]
}
```

PushResultVerifierNode

Realm Operations

Resource path: `/realm-config/authentication/authenticationtrees/nodes/PushResultVerifierNode`

Resource version: `1.0`

create

Usage:

```
am> create PushResultVerifierNode --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "required" : [ ]
}
```

delete

Usage:

```
am> delete PushResultVerifierNode --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action PushResultVerifierNode --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action PushResultVerifierNode --realm Realm --actionName getCreatableTypes
```

listOutcomes

List the available outcomes for the node type.

Usage:

```
am> action PushResultVerifierNode --realm Realm --body body --actionName listOutcomes
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "title" : "Some configuration of the node. This does not need to be complete against the
 configuration schema."
}
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action PushResultVerifierNode --realm Realm --actionName nextdescendents
```

query

Get the full list of instances of this collection. This query only supports `_queryFilter=true` filter.

Usage:

```
am> query PushResultVerifierNode --realm Realm --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read PushResultVerifierNode --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update PushResultVerifierNode --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "required" : [ ]
}
```

PushSender

Realm Operations

Resource path: `/realm-config/authentication/authenticationtrees/nodes/PushAuthenticationSenderNode`

Resource version: `1.0`

create

Usage:

```
am> create PushSender --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "userMessage" : {
      "title" : "User Message",
      "description" : "The message to send to the user. {{user}} and {{issuer}} may be used as
 wildcards.",
      "propertyOrder" : 200,
```

```
      "patternProperties" : {
        ".*" : {
          "type" : "string"
        }
      },
      "type" : "object",
      "exampleValue" : ""
    },
    "mandatory" : {
      "title" : "Remove 'skip' option",
      "description" : "If checked, users will no longer be able to skip the module, and must interact
 with it.",
      "propertyOrder" : 300,
      "type" : "boolean",
      "exampleValue" : ""
    },
    "messageTimeout" : {
      "title" : "Message Timeout",
      "description" : "The duration (in ms) that the message will time out after.",
      "propertyOrder" : 100,
      "type" : "integer",
      "exampleValue" : ""
    }
  },
  "required" : [ "mandatory", "messageTimeout", "userMessage" ]
}
```

delete

Usage:

```
am> delete PushSender --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action PushSender --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action PushSender --realm Realm --actionName getCreatableTypes
```

listOutcomes

List the available outcomes for the node type.

Usage:

```
am> action PushSender --realm Realm --body body --actionName listOutcomes
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "title" : "Some configuration of the node. This does not need to be complete against the
 configuration schema."
}
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action PushSender --realm Realm --actionName nextdescendents
```

query

Get the full list of instances of this collection. This query only supports `_queryFilter=true` filter.

Usage:

```
am> query PushSender --realm Realm --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read PushSender --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update PushSender --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "userMessage" : {
      "title" : "User Message",
      "description" : "The message to send to the user. {{user}} and {{issuer}} may be used as
 wildcards.",
      "propertyOrder" : 200,
      "patternProperties" : {
        ".*" : {
          "type" : "string"
        }
      },
      "type" : "object",
      "exampleValue" : ""
    },
    "mandatory" : {
      "title" : "Remove 'skip' option",
      "description" : "If checked, users will no longer be able to skip the module, and must interact
 with it.",
      "propertyOrder" : 300,
      "type" : "boolean",
      "exampleValue" : ""
    },
    "messageTimeout" : {
      "title" : "Message Timeout",
      "description" : "The duration (in ms) that the message will time out after.",
      "propertyOrder" : 100,
      "type" : "integer",
      "exampleValue" : ""
    }
  },
  "required" : [ "mandatory", "messageTimeout", "userMessage" ]
}
```

PushUserDevices

Realm Operations

The Push devices service is responsible for exposing functions to change the collection of Push authentication devices. The supported methods are action, delete, query

Resource path: `/users/{user}/devices/2fa/push`

Resource version: `1.0`

check

Checks if the user's Authenticator Push module is 'skippable' and returns the result as a boolean

Usage:

```
am> action PushUserDevices --realm Realm --body body --user user --actionName check
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "$schema" : "http://json-schema.org/draft-04/schema#",
  "description" : "Push user device check action request schema",
  "type" : "object",
  "title" : "Push user device check action request schema"
}
```

--user

The Push devices service is responsible for exposing functions to change the collection of Push authentication devices. The supported methods are action, delete, query

delete

Delete Push user device

Usage:

```
am> delete PushUserDevices --realm Realm --id id --user user
```

Parameters:

--id

The unique identifier for the resource.

--user

The Push devices service is responsible for exposing functions to change the collection of Push authentication devices. The supported methods are action, delete, query

query

Query the user's device profile

Usage:

```
am> query PushUserDevices --realm Realm --filter filter --user user
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all. Fields that can be queried: [*]

--user

The Push devices service is responsible for exposing functions to change the collection of Push authentication devices. The supported methods are action, delete, query

reset

Sets the user's 'skippable' selection of Authenticator Push module to default (NOT_SET) and deletes their profile's attribute

Usage:

```
am> action PushUserDevices --realm Realm --body body --user user --actionName reset
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "$schema" : "http://json-schema.org/draft-04/schema#",
  "description" : "Push user device reset action request schema",
  "type" : "object",
  "title" : "Push user device reset action request schema"
}
```

--user

The Push devices service is responsible for exposing functions to change the collection of Push authentication devices. The supported methods are action, delete, query

skip

Sets the user's ability to skip an Authenticator Push module

Usage:

```
am> action PushUserDevices --realm Realm --body body --user user --actionName skip
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "description" : "Push user device skip action request schema",
  "type" : "object",
  "title" : "Push user device skip action request schema",
  "properties" : {
    "value" : {
      "type" : "boolean",
      "title" : "Skip push module response value",
      "description" : "True if the push device is set to skipped"
    }
  },
  "required" : [ "value" ]
}
```

--user

The Push devices service is responsible for exposing functions to change the collection of Push authentication devices. The supported methods are action, delete, query

QueryFilterDecision

Realm Operations

Resource path: `/realm-config/authentication/authenticationtrees/nodes/QueryFilterDecisionNode`

Resource version: `1.0`

create

Usage:

```
am> create QueryFilterDecision --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "identityAttribute" : {
      "title" : "Identity Attribute",
      "description" : "The attribute used to retrieve the object to be tested against the query
 filter.",
      "propertyOrder" : 200,
      "type" : "string",
      "exampleValue" : ""
    },
    "queryFilter" : {
      "title" : "Query Filter",
      "description" : "A query filter tested against an object.",
      "propertyOrder" : 100,
      "type" : "string",
      "exampleValue" : ""
    }
  },
  "required" : [ "queryFilter", "identityAttribute" ]
}
```

delete

Usage:

```
am> delete QueryFilterDecision --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action QueryFilterDecision --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action QueryFilterDecision --realm Realm --actionName getCreatableTypes
```

listOutcomes

List the available outcomes for the node type.

Usage:

```
am> action QueryFilterDecision --realm Realm --body body --actionName listOutcomes
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "title" : "Some configuration of the node. This does not need to be complete against the
 configuration schema."
}
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action QueryFilterDecision --realm Realm --actionName nextdescendents
```

query

Get the full list of instances of this collection. This query only supports `_queryFilter=true` filter.

Usage:

```
am> query QueryFilterDecision --realm Realm --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read QueryFilterDecision --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update QueryFilterDecision --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "identityAttribute" : {
      "title" : "Identity Attribute",
      "description" : "The attribute used to retrieve the object to be tested against the query
 filter.",
      "propertyOrder" : 200,
      "type" : "string",
      "exampleValue" : ""
    },
    "queryFilter" : {
      "title" : "Query Filter",
      "description" : "A query filter tested against an object.",
      "propertyOrder" : 100,
      "type" : "string",
      "exampleValue" : ""
    }
  },
  "required" : [ "queryFilter", "identityAttribute" ]
}
```

RESTSecurityTokenServices

Realm Operations

The REST STS endpoint is responsible for storing the configuration of instances of REST Security Token Services (STS). Available operations are create, read, update, delete, query, schema and template.

Resource path: `/realm-config/services/sts/rest-sts`

Resource version: `1.0`

create

Usage:

```
am> create RESTSecurityTokenServices --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "restStsSaml2" : {
      "type" : "object",
      "title" : "SAML2 Token",
      "propertyOrder" : 2,
      "properties" : {
        "saml2-custom-attribute-mapper-class-name" : {
          "title" : "Custom Attribute Mapper Class Name",
          "description" : "If the class implementing attribute mapping for attributes
 contained in the issued SAML2 assertion needs to be customized, implement the
 <code>org.forgerock.openam.sts.tokengeneration.saml2.statements.AttributeMapper</code> interface, and
 specify the class name of the implementation here.",
          "propertyOrder" : 2100,

        "deployment-offloaded-two-way-tls-header-key" : {
          "title" : "Client Certificate Header Key",
          "description" : "TLS-offload host certificate header key<br><br>Token transformation
 which take X509 Certificates as the input token require that the X509 Certificate be presented
 via two-way TLS, so that the TLS handshake can validate client certificate ownership. A
 standard means of obtaining the client certificate presented via two-way TLS is via the
 javax.servlet.request.X509Certificate attribute in the ServletRequest. However, in TLS-offloaded
 deployments, the TLS-offloader must communicate the client certificate to its ultimate destination
 via an Http header. If this rest-sts instance is to support token transformations with X509
 Certificate input, and OpenAM will be deployed in a TLS-offloaded context, then this value must be
 set to the header value which the TLS-offloading engine will use to set client certificates presented
 via the TLS handshake.",

          "required" : false,
          "type" : "string",
          "exampleValue" : ""
        },
        "deployment-auth-target-mappings" : {
          "title" : "Authentication Target Mappings",
          "description" : "Configuration of consumption of OpenAM's
 rest-authN. For each validated token type (other than OpenAM), the REST
 authN elements which will validate token instances. <br>Entry format:
 <code>TokenType;authIndexType;authIndexValue;context_key=context_value,context_key1=context_value1</
code>. <br>The <code>context_key=context_value</code> entries are optional.<br><br>Each deployed
 STS is configured with the authentication targets for each input token type for each supported
 token transformation. For example, if the transformation OPENIDCONNECT->SAML2 is supported, the
 STS instance must be configured with information specifying which elements of the OpenAM restful
 authentication context needs to be consumed to validate the OPENIDCONNECT token. The elements
 of the configuration tuple are separated by '|'. <br>The first element is the input token type
 in the token transform: i.e. X509, OPENIDCONNECT, USERNAME, or OPENAM. The second element is the
 authentication target - i.e. either 'module' or 'service', and the third element is the name of
 the authentication module or service. The fourth (optional) element provides the STS authentication
 context information about the to-be-consumed authentication context. <br>When transforming OpenID
 Connect Id tokens, the OpenID Connect authentication module must be consumed, and thus a deployed
 rest-sts instance must be configured with the name of the header/cookie element where the OpenID
 Connect Id token will be placed. For this example, the following string would define these
 configurations: <code>OPENIDCONNECT|module|oidc|oidc_id_token_auth_target_header_key=oidc_id_token</
code>. In this case, 'oidc' is the name of the OpenID Connect authentication module created to
 authenticate OpenID Connect tokens. <br>When transforming a X509 Certificate, the Certificate
 module must be consumed, and the published rest-sts instance must be configured with the name of
 the Certificate module (or the service containing the module), and the header name configured for
 the Certificate module corresponding to where the Certificate module can expect to find the to-be-
validated Certificate. The following string would define these configurations: <code>X509|module|
cert_module|x509_token_auth_target_header_key=client_cert</code>. In this case 'cert_module' is the
 name of the Certificate module, and client_cert is the header name where Certificate module has been
 configured to find the client's Certificate.",

}
```

delete

Usage:

```
am> delete RESTSecurityTokenServices --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action RESTSecurityTokenServices --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action RESTSecurityTokenServices --realm Realm --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action RESTSecurityTokenServices --realm Realm --actionName nextdescendents
```

query

Get the full list of instances of this collection. This query only supports `_queryFilter=true` filter.

Usage:

```
am> query RESTSecurityTokenServices --realm Realm --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read RESTSecurityTokenServices --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update RESTSecurityTokenServices --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```

        "deployment-auth-target-mappings" : {
          "title" : "Authentication Target Mappings",
          "description" : "Configuration of consumption of OpenAM's
 rest-authN. For each validated token type (other than OpenAM), the REST
 authN elements which will validate token instances. <br>Entry format:
 <code>TokenType;authIndexType;authIndexValue;context_key=context_value,context_key1=context_value1</
code>. <br>The <code>context_key=context_value</code> entries are optional.<br><br>Each deployed
 STS is configured with the authentication targets for each input token type for each supported
 token transformation. For example, if the transformation OPENIDCONNECT->SAML2 is supported, the
 STS instance must be configured with information specifying which elements of the OpenAM restful
 authentication context needs to be consumed to validate the OPENIDCONNECT token. The elements
 of the configuration tuple are separated by '|'. <br>The first element is the input token type
 in the token transform: i.e. X509, OPENIDCONNECT, USERNAME, or OPENAM. The second element is the
 authentication target - i.e. either 'module' or 'service', and the third element is the name of
 the authentication module or service. The fourth (optional) element provides the STS authentication
 context information about the to-be-consumed authentication context. <br>When transforming OpenID
 Connect Id tokens, the OpenID Connect authentication module must be consumed, and thus a deployed
 rest-sts instance must be configured with the name of the header/cookie element where the OpenID
 Connect Id token will be placed. For this example, the following string would define these
 configurations: <code>OPENIDCONNECT|module|oidc|oidc_id_token_auth_target_header_key=oidc_id_token</
code>. In this case, 'oidc' is the name of the OpenID Connect authentication module created to
 authenticate OpenID Connect tokens. <br>When transforming a X509 Certificate, the Certificate
 module must be consumed, and the published rest-sts instance must be configured with the name of
 the Certificate module (or the service containing the module), and the header name configured for
 the Certificate module corresponding to where the Certificate module can expect to find the to-be-
validated Certificate. The following string would define these configurations: <code>X509|module|
cert_module|x509_token_auth_target_header_key=client_cert</code>. In this case 'cert_module' is the
 name of the Certificate module, and client_cert is the header name where Certificate module has been
 configured to find the client's Certificate.",

    }
  }
}
```

delete

Usage:

```
am> delete RadiusClient --global --id id
```

Parameters:

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action RadiusClient --global --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action RadiusClient --global --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action RadiusClient --global --actionName nextdescendents
```

query

Get the full list of instances of this collection. This query only supports `_queryFilter=true` filter.

Usage:

```
am> query RadiusClient --global --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read RadiusClient --global --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update RadiusClient --global --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "clientIpAddress" : {
      "title" : "Client IP Address",
      "description" : "The IP Address of the client.<br><br><a href=\"http://tools.ietf.org/html/
rfc2865#section-5.4\" target=\"_blank\">Section 5.4 of the RADIUS Authentication Specification,
 RFC 2865</a>, indicates that the source IP address of the Access-Request packet <em>MUST</em> be
 used to identify a configured client and hence determine the shared secret to use for decrypting
 the User-Password field.<p><p>This property should hold the source IP address of the client. This
 should match the value obtained from Java's <code>InetSocketAddress.getAddress().toString()</code>
 function.<p><p>To verify the value, send an Access-Request packet to OpenAM's RADIUS port and watch
 for a message stating: <code>\"No Defined RADIUS Client matches IP address '/127.0.0.1'. Dropping
 request.\"</code>. The value used in this property should match the IP address returned in the single
 quotes.",

    }
  }
}
```

delete

Usage:

```
am> delete RadiusModule --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action RadiusModule --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action RadiusModule --realm Realm --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action RadiusModule --realm Realm --actionName nextdescendents
```

query

Get the full list of instances of this collection. This query only supports `_queryFilter=true` filter.

Usage:

```
am> query RadiusModule --realm Realm --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read RadiusModule --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update RadiusModule --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

}
```

Global Operations

Resource path: `/global-config/authentication/modules/radius`

Resource version: `1.0`

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action RadiusModule --global --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action RadiusModule --global --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action RadiusModule --global --actionName nextdescendents
```

read

Usage:

```
am> read RadiusModule --global
```

update

Usage:

```
am> update RadiusModule --global --body body
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```

RadiusServer

Global Operations

Resource path: `/global-config/services/RadiusServerService`

Resource version: `1.0`

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action RadiusServer --global --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action RadiusServer --global --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action RadiusServer --global --actionName nextdescendents
```

read

Usage:

```
am> read RadiusServer --global
```

update

Usage:

```
am> update RadiusServer --global --body body
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "radiusThreadPoolQueueSize" : {
      "title" : "Thread Pool Queue Size",
      "description" : "The number of requests that can be queued for the pool before further requests
 will be silently dropped. See also \"Thread Pool Core Size\" and \"Thread Pool Max Size\". Specify a
 value from <code>1</code> to <code>1000</code>.",

```

Realms

Global Operations

The endpoint for Realm operations

Resource path: `/global-config/realms`

Resource version: `1.0`

create

Create a Realm

Usage:

```
am> create Realms --global --body body
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "$schema" : "http://json-schema.org/draft-04/schema#",
  "description" : "Represents a Realm Resource",
  "type" : "object",
```

```
  "title" : "Realm",
  "properties" : {
    "name" : {
      "type" : "string",
      "title" : "Name",
      "description" : "The name of the Realm"
    },
    "active" : {
      "type" : "boolean",
      "title" : "Active",
      "description" : "True if the Realm is active"
    },
    "parentPath" : {
      "type" : "string",
      "title" : "Parent",
      "description" : "The path of the Realm's parent Realm"
    },
    "aliases" : {
      "type" : "array",
      "title" : "Aliases",
      "description" : "Aliases which can be used reference to the Realm",
      "items" : {
        "type" : "string"
      }
    }
  },
  "required" : [ "name", "active", "parentPath", "aliases" ]
}
```

delete

Delete a Realm

Usage:

```
am> delete Realms --global --id id
```

Parameters:

--id

The unique identifier for the resource.

query

Usage:

```
am> query Realms --global --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Read a Realm

Usage:

```
am> read Realms --global --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Update a Realm

Usage:

```
am> update Realms --global --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "$schema" : "http://json-schema.org/draft-04/schema#",
  "description" : "Represents a Realm Resource",
  "type" : "object",
  "title" : "Realm",
  "properties" : {
    "name" : {
      "type" : "string",
      "title" : "Name",
      "description" : "The name of the Realm"
    },
    "active" : {
      "type" : "boolean",
      "title" : "Active",
      "description" : "True if the Realm is active"
    },
    "parentPath" : {
      "type" : "string",
      "title" : "Parent",
      "description" : "The path of the Realm's parent Realm"
    },
    "aliases" : {
      "type" : "array",
      "title" : "Aliases",
      "description" : "Aliases which can be used reference to the Realm",
```

```
      "items" : {
        "type" : "string"
      }
    }
  },
  "required" : [ "name", "active", "parentPath", "aliases" ]
}
```

Records

Realm Operations

Service for creating records.

Resource path: `/records`

Resource version: `1.0`

start

Starts recording.

Usage:

```
am> action Records --realm Realm --body body --actionName start
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "description" : "The properties of a Record, which can deserialized from json.",
  "type" : "object",
  "title" : "Record properties",
  "properties" : {
    "issueID" : {
      "description" : "A case number is a good choice for the issueID value.",
      "title" : "Issue ID",
      "type" : "integer",
      "format" : "int64"
    },
    "referenceID" : {
      "description" : "A second identifier to segregate multiple recording events for the same
 issue.",
      "title" : "Reference ID",
      "type" : "string"
    },
    "description" : {
      "description" : "A textual description of the recording event.",
      "title" : "Description",
      "type" : "string"
```

```
    },
    "threadDump" : {
      "description" : "Object used to specify thread dump settings.",
      "title" : "Thread dump settings",
      "type" : "object",
      "properties" : {
        "enable" : {
          "description" : "Whether to dump threads during the recording event.",
          "title" : "Thread dump enabled",
          "type" : "boolean"
        },
        "delay" : {
          "description" : "Object used to specify an interval at which thread dumps are taken. The
initial thread dump is taken at the start of the recording event; subsequent thread dumps are taken
at multiples of the delay interval.",
          "title" : "Thread dump delay",
          "type" : "object",
          "properties" : {
            "timeUnit" : {
              "description" : "The time unit being used to specify the delay for the thread dumps.",
              "title" : "Thread dump delay time unit",
              "type" : "string",
              "enum" : [ "DAYS", "HOURS", "MINUTES", "SECONDS", "MILLISECONDS", "MICROSECONDS",
"NANOSECONDS" ]
            },
            "value" : {
              "description" : "The value for the thread dump delay, in the specified thread dump delay
time unit. The initial thread dump is taken at the start of the recording event; subsequent thread
dumps are taken at multiples of the delay interval.",
              "title" : "Thread dump delay value",
              "type" : "integer",
              "format" : "int64"
            }
          }
        }
      }
    },
    "configExport" : {
      "description" : "Configuration Export properties.",
      "title" : "Configuration export properties",

                  "title" : "Auto stop file size measurement unit",
                  "type" : "string",
                  "enum" : [ "GB", "MB", "KB", "B" ]
                },
                "value" : {
                  "description" : "The size value after which auto stop will occur",
                  "title" : "Auto stop file size value",
                  "type" : "integer",
                  "format" : "int64"
```

```
                }
              }
            }
          }
        }
      }
    },
    "zipEnable" : {
      "description" : "Whether to compress the output directory into a zip file when recording has
 stopped.",
      "title" : "Zip enabled",
      "type" : "boolean"
    }
  }
}
```

status

Returns status of recording.

Usage:

```
am> action Records --realm Realm --actionName status
```

stop

Stops recording.

Usage:

```
am> action Records --realm Realm --actionName stop
```

RecoveryCodeCollectorDecision

Realm Operations

Resource path: `/realm-config/authentication/authenticationtrees/nodes/RecoveryCodeCollectorDecisionNode`

Resource version: `1.0`

create

Usage:

```
am> create RecoveryCodeCollectorDecision --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "recoveryCodeType" : {
      "title" : "Recovery Code Type",
      "description" : "Determines which type of recovery codes are going to be validated for the
 user.",
      "propertyOrder" : 100,
      "type" : "string",
      "exampleValue" : ""
    }
  },
  "required" : [ "recoveryCodeType" ]
}
```

delete

Usage:

```
am> delete RecoveryCodeCollectorDecision --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action RecoveryCodeCollectorDecision --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action RecoveryCodeCollectorDecision --realm Realm --actionName getCreatableTypes
```

listOutcomes

List the available outcomes for the node type.

Usage:

```
am> action RecoveryCodeCollectorDecision --realm Realm --body body --actionName listOutcomes
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "title" : "Some configuration of the node. This does not need to be complete against the
 configuration schema."
}
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action RecoveryCodeCollectorDecision --realm Realm --actionName nextdescendents
```

query

Get the full list of instances of this collection. This query only supports `_queryFilter=true` filter.

Usage:

```
am> query RecoveryCodeCollectorDecision --realm Realm --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read RecoveryCodeCollectorDecision --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update RecoveryCodeCollectorDecision --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "recoveryCodeType" : {
      "title" : "Recovery Code Type",
      "description" : "Determines which type of recovery codes are going to be validated for the
 user.",
      "propertyOrder" : 100,
      "type" : "string",
      "exampleValue" : ""
    }
  },
  "required" : [ "recoveryCodeType" ]
}
```

RecoveryCodeDisplayNode

Realm Operations

Resource path: `/realm-config/authentication/authenticationtrees/nodes/RecoveryCodeDisplayNode`

Resource version: `1.0`

create

Usage:

```
am> create RecoveryCodeDisplayNode --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "required" : [ ]
}
```

delete

Usage:

```
am> delete RecoveryCodeDisplayNode --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action RecoveryCodeDisplayNode --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action RecoveryCodeDisplayNode --realm Realm --actionName getCreatableTypes
```

listOutcomes

List the available outcomes for the node type.

Usage:

```
am> action RecoveryCodeDisplayNode --realm Realm --body body --actionName listOutcomes
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "title" : "Some configuration of the node. This does not need to be complete against the
 configuration schema."
}
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action RecoveryCodeDisplayNode --realm Realm --actionName nextdescendents
```

query

Get the full list of instances of this collection. This query only supports `_queryFilter=true` filter.

Usage:

```
am> query RecoveryCodeDisplayNode --realm Realm --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read RecoveryCodeDisplayNode --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update RecoveryCodeDisplayNode --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "required" : [ ]
}
```

RegisterLogoutWebhook

Realm Operations

Resource path: `/realm-config/authentication/authenticationtrees/nodes/RegisterLogoutWebhookNode`

Resource version: `1.0`

create

Usage:

```
am> create RegisterLogoutWebhook --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "webhookName" : {
      "title" : "Webhook Name",
      "description" : "The name of the webhook stored using the webhook service.",
      "propertyOrder" : 100,
      "type" : "string",
      "exampleValue" : ""
    }
  },
  "required" : [ "webhookName" ]
}
```

delete

Usage:

```
am> delete RegisterLogoutWebhook --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action RegisterLogoutWebhook --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action RegisterLogoutWebhook --realm Realm --actionName getCreatableTypes
```

listOutcomes

List the available outcomes for the node type.

Usage:

```
am> action RegisterLogoutWebhook --realm Realm --body body --actionName listOutcomes
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "title" : "Some configuration of the node. This does not need to be complete against the
 configuration schema."
}
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action RegisterLogoutWebhook --realm Realm --actionName nextdescendents
```

query

Get the full list of instances of this collection. This query only supports `_queryFilter=true` filter.

Usage:

```
am> query RegisterLogoutWebhook --realm Realm --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read RegisterLogoutWebhook --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update RegisterLogoutWebhook --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "webhookName" : {
      "title" : "Webhook Name",
      "description" : "The name of the webhook stored using the webhook service.",
      "propertyOrder" : 100,
      "type" : "string",
      "exampleValue" : ""
    }
  },
  "required" : [ "webhookName" ]
}
```

RegisterThing

Realm Operations

Resource path: `/realm-config/authentication/authenticationtrees/nodes/IotRegistrationNode`

Resource version: `1.0`

create

Usage:

```
am> create RegisterThing --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "createIdentity" : {
      "title" : "Create Identity",
      "description" : "Create a new identity for the thing if one does not exist already.",
      "propertyOrder" : 20,
      "type" : "boolean",
```

```
      "exampleValue" : ""
    },
    "allowAttributeOverwrite" : {
      "title" : "Overwrite Attributes",
      "description" : "Allow existing identity attributes to be overwritten when new claims are
 provided for the thing.",
      "propertyOrder" : 50,
      "type" : "boolean",
      "exampleValue" : ""
    },
    "claimToAttributeMapping" : {
      "title" : "Claim to Attribute Mapping",
      "description" : "Map the verified claims to the thing's attributes. The value on the left is the
 name of the claim in the verified claims JWT. The value on the right is the name of the attribute in
 the data store.",
      "propertyOrder" : 40,
      "patternProperties" : {
        ".*" : {
          "type" : "string"
        }
      },
      "type" : "object",
      "exampleValue" : ""
    },
    "allowKeyRotation" : {
      "title" : "Rotate Confirmation Key",
      "description" : "Allow multiple confirmation keys to be registered for a thing.",
      "propertyOrder" : 30,
      "type" : "boolean",
      "exampleValue" : ""
    },
    "verifySubject" : {
      "title" : "Verify Certificate Subject",
      "description" : "Verify that the subject provided in the JWT is the same as either the X.509
 certificate subject CN or UID.",
      "propertyOrder" : 10,
      "type" : "boolean",
      "exampleValue" : ""
    }
  },
  "required" : [ "allowKeyRotation", "allowAttributeOverwrite", "claimToAttributeMapping",
 "createIdentity", "verifySubject" ]
}
```

delete

Usage:

```
am> delete RegisterThing --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action RegisterThing --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action RegisterThing --realm Realm --actionName getCreatableTypes
```

listOutcomes

List the available outcomes for the node type.

Usage:

```
am> action RegisterThing --realm Realm --body body --actionName listOutcomes
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "title" : "Some configuration of the node. This does not need to be complete against the
 configuration schema."
}
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action RegisterThing --realm Realm --actionName nextdescendents
```

query

Get the full list of instances of this collection. This query only supports `_queryFilter=true` filter.

Usage:

```
am> query RegisterThing --realm Realm --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read RegisterThing --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update RegisterThing --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "createIdentity" : {
      "title" : "Create Identity",
      "description" : "Create a new identity for the thing if one does not exist already.",
      "propertyOrder" : 20,

RemoteConsentAgent

Realm Operations

Agents handler that is responsible for managing agents

Resource path: `/realm-config/agents/RemoteConsentAgent`

Resource version: `1.0`

create

Usage:

```
am> create RemoteConsentAgent --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "remoteConsentResponseEncryptionAlgorithm" : {
      "title" : "Consent response encryption algorithm",
      "description" : "The encryption algorithm to be used by the provider when decrypting the remote
 consent response JWT received from the Remote Consent Service.",
      "propertyOrder" : 34500,
      "type" : "object",
      "exampleValue" : "",
      "properties" : {
        "inherited" : {
          "type" : "boolean",

    }
  }
}
```

delete

Usage:

```
am> delete RemoteConsentAgent --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action RemoteConsentAgent --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action RemoteConsentAgent --realm Realm --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action RemoteConsentAgent --realm Realm --actionName nextdescendents
```

query

Querying the agents of a specific type

Usage:

```
am> query RemoteConsentAgent --realm Realm --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read RemoteConsentAgent --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update RemoteConsentAgent --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```

RemoteConsentService

Realm Operations

Resource path: `/realm-config/services/RemoteConsentService`

Resource version: `1.0`

create

Usage:

```
am> create RemoteConsentService --realm Realm --body body
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "consentResponseTimeLimit" : {
      "title" : "Consent Response Time Limit (in minutes)",
      "description" : "The time limit set on the consent response JWT before it expires, in minutes.",
      "propertyOrder" : 700,
      "required" : true,
      "type" : "integer",
      "exampleValue" : ""
    },
    "clientId" : {
      "title" : "Client Name",
      "description" : "The name used to identify this OAuth 2.0 remote consent service when
 referencedin other services.",
      "propertyOrder" : 100,
      "required" : true,
      "type" : "string",
      "exampleValue" : ""
    },
    "encryptionKeyAlias" : {
      "title" : "Encryption Key Alias",
      "description" : "The alias of the key in the default keystore to use for encryption.",
```

```
      "propertyOrder" : 300,
      "required" : true,
      "type" : "string",
      "exampleValue" : ""
    },
    "signingKeyAlias" : {
      "title" : "Signing Key Alias",
      "description" : "The alias of the key in the default keystore to use for signing.",
      "propertyOrder" : 200,
      "required" : true,
      "type" : "string",
      "exampleValue" : ""
    },
    "jwksUriAS" : {
      "title" : "Authorization Server jwk_uri",
      "description" : "The jwk_uri for retrieving the authorization server signing and encryption
 keys.",
      "propertyOrder" : 400,
      "required" : true,
      "type" : "string",
      "exampleValue" : ""
    },
    "jwkStoreCacheMissCacheTime" : {
      "title" : "JWK Store Cache Miss Cache Time (in minutes)",
      "description" : "The length of time a cache miss is cached, in minutes.",
      "propertyOrder" : 600,
      "required" : true,
      "type" : "integer",

    },
    "jwkStoreCacheTimeout" : {
      "title" : "JWK Store Cache Timeout (in minutes)",
      "description" : "The cache timeout for the JWK store of the authorization server, in minutes.",
      "propertyOrder" : 500,
      "required" : true,
      "type" : "integer",
      "exampleValue" : ""
    }
  }
}
```

delete

Usage:

```
am> delete RemoteConsentService --realm Realm
```

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action RemoteConsentService --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action RemoteConsentService --realm Realm --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action RemoteConsentService --realm Realm --actionName nextdescendents
```

read

Usage:

```
am> read RemoteConsentService --realm Realm
```

update

Usage:

```
am> update RemoteConsentService --realm Realm --body body
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "consentResponseTimeLimit" : {
      "title" : "Consent Response Time Limit (in minutes)",
      "description" : "The time limit set on the consent response JWT before it expires, in minutes.",
      "propertyOrder" : 700,
      "required" : true,
      "type" : "integer",
      "exampleValue" : ""
    },
    "clientId" : {
      "title" : "Client Name",
      "description" : "The name used to identify this OAuth 2.0 remote consent service when
 referencedin other services.",
      "propertyOrder" : 100,
      "required" : true,
      "type" : "string",
      "exampleValue" : ""
```

```
    },
    "encryptionKeyAlias" : {
      "title" : "Encryption Key Alias",
      "description" : "The alias of the key in the default keystore to use for encryption.",

      "exampleValue" : ""
    }
  }
}
```

Global Operations

Resource path: `/global-config/services/RemoteConsentService`

Resource version: `1.0`

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action RemoteConsentService --global --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action RemoteConsentService --global --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action RemoteConsentService --global --actionName nextdescendents
```

read

Usage:

```
am> read RemoteConsentService --global
```

update

Usage:

```
am> update RemoteConsentService --global --body body
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",

}
```

RemoteSaml2EntityProvider

Realm Operations

Allows the management of remote SAML2 entity providers.

Resource path: `/realm-config/saml2/remote`

Resource version: `1.0`

delete

Removes the SAML2 entity provider from the configuration including all of its associated roles.

Usage:

```
am> delete RemoteSaml2EntityProvider --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

importEntity

Import the standard metadata of a remote entity provider.

Usage:

```
am> action RemoteSaml2EntityProvider --realm Realm --body body --actionName importEntity
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "$schema" : "http://json-schema.org/draft-04/schema#",
  "description" : "The JSON schema for importEntity action requests.",
  "type" : "object",
  "title" : "Import remote entity provider request",
  "properties" : {
    "standardMetadata" : {
      "type" : "string",
      "title" : "Standard Metadata",
      "description" : "The standard SAML metadata for the remote entity provider. The value should be
 Base64url encoded."
    }
  },
  "required" : [ "standardMetadata" ]
}
```

read

Returns the roles of the SAML2 entity provider.

Usage:

```
am> read RemoteSaml2EntityProvider --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Updates details of the SAML2 entity provider role.

Usage:

```
am> update RemoteSaml2EntityProvider --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "$schema" : "http://json-schema.org/draft-07/schema#",
  "ignoredProperties" : [ "_id", "_rev" ],
  "description" : "This schema describes a remote SAML2 entity provider.",

```

RemoveSessionProperties

Realm Operations

Resource path: `/realm-config/authentication/authenticationtrees/nodes/RemoveSessionPropertiesNode`

Resource version: `1.0`

create

Usage:

```
am> create RemoveSessionProperties --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "propertyNames" : {
      "title" : "Property Names",
      "description" : "The names of session properties to remove that may have been contributed by
 nodes that executedearlier in the tree. If the properties do not exist, no error will be thrown.
 Names are case sensitive.",
      "propertyOrder" : 100,
      "items" : {
        "type" : "string"
      },
      "minItems" : 1,
      "type" : "array",
      "exampleValue" : ""
    }
  },
  "required" : [ "propertyNames" ]
}
```

delete

Usage:

```
am> delete RemoveSessionProperties --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action RemoveSessionProperties --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action RemoveSessionProperties --realm Realm --actionName getCreatableTypes
```

listOutcomes

List the available outcomes for the node type.

Usage:

```
am> action RemoveSessionProperties --realm Realm --body body --actionName listOutcomes
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "title" : "Some configuration of the node. This does not need to be complete against the
 configuration schema."
}
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action RemoveSessionProperties --realm Realm --actionName nextdescendents
```

query

Get the full list of instances of this collection. This query only supports `_queryFilter=true` filter.

Usage:

```
am> query RemoveSessionProperties --realm Realm --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read RemoveSessionProperties --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update RemoveSessionProperties --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "propertyNames" : {
      "title" : "Property Names",
      "description" : "The names of session properties to remove that may have been contributed by
 nodes that executedearlier in the tree. If the properties do not exist, no error will be thrown.
 Names are case sensitive.",
      "propertyOrder" : 100,
      "items" : {
        "type" : "string"
      },
      "minItems" : 1,
      "type" : "array",
      "exampleValue" : ""
    }
  },
  "required" : [ "propertyNames" ]
}
```

RequiredAttributesPresent

Realm Operations

Resource path: `/realm-config/authentication/authenticationtrees/nodes/RequiredAttributesDecisionNode`

Resource version: `1.0`

create

Usage:

```
am> create RequiredAttributesPresent --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "identityResource" : {
      "title" : "Identity Resource",
      "description" : "The identity resource in IDM for which the required attributes list will be
 fetched. Must match identity resource of the current tree.",
      "propertyOrder" : 100,
      "type" : "string",
      "exampleValue" : ""
    }
  },
  "required" : [ "identityResource" ]
}
```

delete

Usage:

```
am> delete RequiredAttributesPresent --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action RequiredAttributesPresent --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action RequiredAttributesPresent --realm Realm --actionName getCreatableTypes
```

listOutcomes

List the available outcomes for the node type.

Usage:

```
am> action RequiredAttributesPresent --realm Realm --body body --actionName listOutcomes
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "title" : "Some configuration of the node. This does not need to be complete against the
 configuration schema."
}
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action RequiredAttributesPresent --realm Realm --actionName nextdescendents
```

query

Get the full list of instances of this collection. This query only supports `_queryFilter=true` filter.

Usage:

```
am> query RequiredAttributesPresent --realm Realm --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read RequiredAttributesPresent --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update RequiredAttributesPresent --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "identityResource" : {
      "title" : "Identity Resource",
      "description" : "The identity resource in IDM for which the required attributes list will be
 fetched. Must match identity resource of the current tree.",
      "propertyOrder" : 100,
      "type" : "string",
      "exampleValue" : ""
    }
  },
  "required" : [ "identityResource" ]
}
```

ResourceSets

Realm Operations

Resource set resource provider is responsible for managing Resource Sets belonging to a user. Available operations are update, query, read, revoke all action.

Resource path: `/users/{user}/oauth2/resources/sets`

Resource version: `1.0`

query

Query the collection of the user's Resource Set.

Usage:

```
am> query ResourceSets --realm Realm --filter filter --user user
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all. Fields that can be queried: [*]

--user

Resource set resource provider is responsible for managing Resource Sets belonging to a user. Available operations are update, query, read, revoke all action.

read

Read Resource Set from the collection by id.

Usage:

```
am> read ResourceSets --realm Realm --id id --user user
```

Parameters:

--id

The unique identifier for the resource.

--user

Resource set resource provider is responsible for managing Resource Sets belonging to a user. Available operations are update, query, read, revoke all action.

update

Update a Resource Set record.

Usage:

```
am> update ResourceSets --realm Realm --id id --body body --user user
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "$schema" : "http://json-schema.org/draft-04/schema#",
  "description" : "Describes the structure of the OpenAM representation of a user's OAuth Resource
 Set. For further  information see [insert link to the RSR standard], and documentation about UMA in
 OpenAM.",
  "type" : "object",
  "title" : "Resource Set resource schema",
  "properties" : {
    "scopes" : {
      "type" : "array",
      "title" : "Scopes",
      "description" : "List of Resource Set scopes.",
      "items" : {
        "type" : "string"
      }
    },
    "_id" : {
      "type" : "string",
      "title" : "Resource set id",
      "description" : "Unique identifier of the Resource Set."
    },
    "resourceServer" : {
      "type" : "string",
      "title" : "Resource server",
      "description" : "The resources server name."
    },
    "labels" : {
      "type" : "array",
      "title" : "Resource labels",
      "description" : "Labels of the resource.",
      "items" : {
        "type" : "string"
      }
    },
    "name" : {
      "type" : "string",
      "title" : "Resource name",
      "description" : "Name of the resource."
    },
    "icon_uri" : {
      "type" : "string",
      "title" : "Icon uri",
      "description" : "Resource icon uri."
    },
    "resourceOwnerId" : {
      "type" : "string",
      "title" : "Resource owner",
      "description" : "Name of the resource owner."
    },
    "type" : {
      "type" : "string",
      "title" : "Resource type",
      "description" : "Type of the resources."
    }
  }
```

```
}
```

--user

Resource set resource provider is responsible for managing Resource Sets belonging to a user. Available operations are update, query, read, revoke all action.

ResourceTypes

Realm Operations

The Resource Types resource is responsible for managing resource types, which define a template for the resources that Managing Policies policies apply to, and the actions associated with those resources. Available operations are Query, Read, Create, Update, Delete

Resource path: `/resourcetypes`

Resource version: `1.0`

create

Create new resource type

Usage:

```
am> create ResourceTypes --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "$schema" : "http://json-schema.org/draft-04/schema#",
  "description" : "Resource Types Resource schema",
  "type" : "object",
  "title" : "Resource Types Resource schema",
  "properties" : {
    "uuid" : {
      "title" : "UUID",
      "description" : "Unique identifier of the record",
      "type" : "string"
    },
    "name" : {
      "title" : "Name",
```

```
      "description" : "Resource type name",
      "type" : "string"
    },
    "description" : {
      "title" : "Description",
      "description" : "Resource type description",
      "type" : "string"
    },
    "patterns" : {
      "title" : "Patterns",
      "description" : "Resource type patterns",
      "type" : "array",
      "items" : {
        "type" : "string"
      }
    },
    "actions" : {
      "title" : "Actions",
      "description" : "Resource type actions",
      "type" : "object",
      "additionalProperties" : {
        "type" : "boolean"
      }
    },
    "createdBy" : {
      "title" : "Created by",
      "description" : "A string containing the universal identifier DN of the subject created the
 resource type",
      "type" : "string"
    },
    "creationDate" : {
      "title" : "Creation date",
      "description" : "An integer containing the creation date and time, in ISO 8601 format",
      "type" : "number"
    },
    "lastModifiedBy" : {
      "title" : "Last modifier",
      "description" : "A string containing the universal identifier DN of the subject that most
 recently updated the resource type. If the resource type has not been modified since it was created,
 this property will have the same value as createdBy",
      "type" : "string"
    },
    "lastModifiedDate" : {
      "title" : "Last modification date",
      "description" : "A string containing the last modified date and time, in ISO 8601 format. If the
 resource typ has not been modified since it was created, this property will have the same value as
 creationDate",
      "type" : "number"
    }
  }
}
```

delete

Delete resource type

Usage:

```
am> delete ResourceTypes --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

query

Query the collection of resource types

Usage:

```
am> query ResourceTypes --realm Realm --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all. Fields that can be queried: [*]

read

Read from the resource types collection by unique identifier

Usage:

```
am> read ResourceTypes --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Update an existing resource type

Usage:

```
am> update ResourceTypes --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "$schema" : "http://json-schema.org/draft-04/schema#",
  "description" : "Resource Types Resource schema",
  "type" : "object",
  "title" : "Resource Types Resource schema",
  "properties" : {
    "uuid" : {
      "title" : "UUID",
      "description" : "Unique identifier of the record",
      "type" : "string"
    },
    "name" : {
      "title" : "Name",
      "description" : "Resource type name",
      "type" : "string"
    },
    "description" : {
      "title" : "Description",
      "description" : "Resource type description",
      "type" : "string"
    },
    "patterns" : {
      "title" : "Patterns",
      "description" : "Resource type patterns",
      "type" : "array",
      "items" : {
        "type" : "string"
      }
    },
    "actions" : {
      "title" : "Actions",
      "description" : "Resource type actions",
      "type" : "object",
      "additionalProperties" : {
        "type" : "boolean"
      }
    },
    "createdBy" : {
      "title" : "Created by",
      "description" : "A string containing the universal identifier DN of the subject created the
 resource type",
      "type" : "string"
    },
    "creationDate" : {
      "title" : "Creation date",
      "description" : "An integer containing the creation date and time, in ISO 8601 format",
      "type" : "number"
    },
    "lastModifiedBy" : {
      "title" : "Last modifier",
      "description" : "A string containing the universal identifier DN of the subject that most
 recently updated the resource type. If the resource type has not been modified since it was created,
 this property will have the same value as createdBy",
      "type" : "string"
    },
```

```
    "lastModifiedDate" : {
      "title" : "Last modification date",
      "description" : "A string containing the last modified date and time, in ISO 8601 format. If the
 resource typ has not been modified since it was created, this property will have the same value as
 creationDate",
      "type" : "number"
    }
  }
}
```

RestApis

Global Operations

Resource path: `/global-config/services/rest`

Resource version: `1.0`

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action RestApis --global --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action RestApis --global --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action RestApis --global --actionName nextdescendents
```

read

Usage:

```
am> read RestApis --global
```

update

Usage:

```
am> update RestApis --global --body body
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "defaultVersion" : {
      "title" : "Default Resource Version",
      "description" : "The API resource version to use when the REST request does not specify an
 explicit version. Choose from:<br><br><ul><li><code>Latest</code>. If an explicit version is not
 specified, the latest resource version of an API is used.</li><li><code>Oldest</code>. If an explicit
 version is not specified, the oldest supported resource version of an API is used. Note that since
 APIs may be deprecated and fall out of support, the oldest <i>supported</i> version may not be the
 first version.</li><li><code>None</code>. If an explicit version is not specified, the request will
 not be handled and an error status is returned.</li></ul>",
      "propertyOrder" : 100,
      "required" : true,
      "type" : "string",
      "exampleValue" : ""
    },
    "csrfFilterEnabled" : {
      "title" : "Enable CSRF Protection",
      "description" : "If enabled, all non-read/query requests will require the X-Requested-With
 header to be present.<br><br>Requiring a non-standard header ensures requests can only be made via
 methods (XHR) that have stricter same-origin policy protections in Web browsers, preventing Cross-
Site Request Forgery (CSRF) attacks. Without this filter, cross-origin requests are prevented by the
 use of the application/json Content-Type header, which is less robust.",
      "propertyOrder" : 500,
      "required" : true,
      "type" : "boolean",

      "exampleValue" : ""
    }
  }
}
```

RetryLimitDecision

Realm Operations

Resource path: `/realm-config/authentication/authenticationtrees/nodes/RetryLimitDecisionNode`

Resource version: `1.0`

create

Usage:

```
am> create RetryLimitDecision --realm Realm --id id --body body
```

Parameters:

`--id`

The unique identifier for the resource.

`--body`

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "incrementUserAttributeOnFailure" : {
      "title" : "Save Retry Limit to User",
      "description" : "If true the number of failures will be persisted beyond the scope of the
 execution of this tree by saving them to an attribute on the user. If no user can be identified as
 part of the tree context then the execution of the tree will end with an error. If this is false then
 failures will be only be stored in the context of the current tree execution and will be lost if the
 tree execution is restarted.",
      "propertyOrder" : 200,
      "type" : "boolean",
      "exampleValue" : ""
    },
    "retryLimit" : {
      "title" : "Retry Limit",
      "description" : "The number of times to allow a retry.",
      "propertyOrder" : 100,
      "type" : "integer",
      "exampleValue" : ""
    }
  },
  "required" : [ "incrementUserAttributeOnFailure", "retryLimit" ]
}
```

delete

Usage:

```
am> delete RetryLimitDecision --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action RetryLimitDecision --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action RetryLimitDecision --realm Realm --actionName getCreatableTypes
```

listOutcomes

List the available outcomes for the node type.

Usage:

```
am> action RetryLimitDecision --realm Realm --body body --actionName listOutcomes
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "title" : "Some configuration of the node. This does not need to be complete against the
 configuration schema."
}
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action RetryLimitDecision --realm Realm --actionName nextdescendents
```

query

Get the full list of instances of this collection. This query only supports `_queryFilter=true` filter.

Usage:

```
am> query RetryLimitDecision --realm Realm --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read RetryLimitDecision --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update RetryLimitDecision --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "incrementUserAttributeOnFailure" : {
      "title" : "Save Retry Limit to User",
      "description" : "If true the number of failures will be persisted beyond the scope of the
 execution of this tree by saving them to an attribute on the user. If no user can be identified as
 part of the tree context then the execution of the tree will end with an error. If this is false then
 failures will be only be stored in the context of the current tree execution and will be lost if the
 tree execution is restarted.",
      "propertyOrder" : 200,
      "type" : "boolean",
      "exampleValue" : ""
    },
    "retryLimit" : {
      "title" : "Retry Limit",
      "description" : "The number of times to allow a retry.",
      "propertyOrder" : 100,
      "type" : "integer",
      "exampleValue" : ""
    }
  },
  "required" : [ "incrementUserAttributeOnFailure", "retryLimit" ]
}
```

SAML2Authentication

Realm Operations

Resource path: `/realm-config/authentication/authenticationtrees/nodes/product-Saml2Node`

Resource version: `1.0`

create

Usage:

```
am> create SAML2Authentication --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "binding" : {
      "title" : "Response Binding",

 "idpEntityId", "requestBinding", "authComparison", "metaAlias", "authnContextDeclRef", "forceAuthn",
 "binding" ]
}
```

delete

Usage:

```
am> delete SAML2Authentication --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action SAML2Authentication --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action SAML2Authentication --realm Realm --actionName getCreatableTypes
```

listOutcomes

List the available outcomes for the node type.

Usage:

```
am> action SAML2Authentication --realm Realm --body body --actionName listOutcomes
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "title" : "Some configuration of the node. This does not need to be complete against the
 configuration schema."
}
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action SAML2Authentication --realm Realm --actionName nextdescendents
```

query

Get the full list of instances of this collection. This query only supports `_queryFilter=true` filter.

Usage:

```
am> query SAML2Authentication --realm Realm --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read SAML2Authentication --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update SAML2Authentication --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```

SOAPSecurityTokenServices

Realm Operations

The SOAP STS endpoint is responsible for storing the configuration of instances of REST Security Token Services (STS). Available operations are create, read, update, delete, query, schema and template.

Resource path: `/realm-config/services/sts/soap-sts`

Resource version: `1.0`

create

Usage:

```
am> create SOAPSecurityTokenServices --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "soapStsOidc" : {
```

```
      "type" : "object",
      "title" : "OpenID Connect Token ",
      "propertyOrder" : 4,
      "properties" : {
        "oidc-audience" : {
          "title" : "Issued Tokens Audience",
          "description" : "Contents will be set in the aud claim",
          "propertyOrder" : 5900,
          "required" : true,
          "items" : {
            "type" : "string"
          },
          "type" : "array",
          "exampleValue" : ""
        },
        "oidc-claim-map" : {
          "title" : "Claim Map",
          "description" : "Contains the mapping of OIDC token claim names (Map keys) to local
 OpenAM attributes (Map values) in configured data stores. Format: <code>claim_name=attribute_name</
code><br><br>The keys in the map will be claim entries in the issued OIDC token, and the value of
 these claims will be the principal attribute state resulting from LDAP datastore lookup of the map
 values. If no values are returned from the LDAP datastore lookup of the attribute corresponding to
 the map value, no claim will be set in the issued OIDC token.",

 STS is configured with the authentication targets for each input token type for each supported
 token transformation. For example, if the transformation OPENIDCONNECT->SAML2 is supported, the
 STS instance must be configured with information specifying which elements of the OpenAM restful
 authentication context needs to be consumed to validate the OPENIDCONNECT token. The elements
 of the configuration tuple are separated by '|'. <br>The first element is the input token type
 in the token transform: i.e. X509, OPENIDCONNECT, USERNAME, or OPENAM. The second element is the
 authentication target - i.e. either 'module' or 'service', and the third element is the name of
 the authentication module or service. The fourth (optional) element provides the STS authentication
 context information about the to-be-consumed authentication context. <r>When transforming OpenID
 Connect Id tokens, the OpenID Connect authentication module must be consumed, and thus a deployed
 rest-sts instance must be configured with the name of the header/cookie element where the OpenID
 Connect Id token will be placed. For this example, the following string would define these
 configurations: <code>OPENIDCONNECT|module|oidc|oidc_id_token_auth_target_header_key=oidc_id_token</
code>. In this case, 'oidc' is the name of the OpenID Connect authentication module created to
 authenticate OpenID Connect tokens. <br>When transforming a X509 Certificate, the Certificate
 module must be consumed, and the published rest-sts instance must be configured with the name of
 the Certificate module (or the service containing the module), and the header name configured for
 the Certificate module corresponding to where the Certificate module can expect to find the to-be-
validated Certificate. The following string would define these configurations: <code>X509|module|
cert_module|x509_token_auth_target_header_key=client_cert</code>. In this case 'cert_module' is the
 name of the Certificate module, and client_cert is the header name where Certificate module has been
 configured to find the client's Certificate.",

delete

Usage:

```
am> delete SOAPSecurityTokenServices --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action SOAPSecurityTokenServices --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action SOAPSecurityTokenServices --realm Realm --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action SOAPSecurityTokenServices --realm Realm --actionName nextdescendents
```

query

Get the full list of instances of this collection. This query only supports `_queryFilter=true` filter.

Usage:

```
am> query SOAPSecurityTokenServices --realm Realm --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read SOAPSecurityTokenServices --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update SOAPSecurityTokenServices --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```

          "title" : "Authentication Target Mappings",
          "description" : "Configuration of consumption of OpenAM's rest-authN<br><br>Each deployed
 STS is configured with the authentication targets for each input token type for each supported
 token transformation. For example, if the transformation OPENIDCONNECT->SAML2 is supported, the
 STS instance must be configured with information specifying which elements of the OpenAM restful
 authentication context needs to be consumed to validate the OPENIDCONNECT token. The elements
 of the configuration tuple are separated by '|'. <br>The first element is the input token type
 in the token transform: i.e. X509, OPENIDCONNECT, USERNAME, or OPENAM. The second element is the
 authentication target - i.e. either 'module' or 'service', and the third element is the name of
 the authentication module or service. The fourth (optional) element provides the STS authentication
 context information about the to-be-consumed authentication context. <r>When transforming OpenID
 Connect Id tokens, the OpenID Connect authentication module must be consumed, and thus a deployed
 rest-sts instance must be configured with the name of the header/cookie element where the OpenID
 Connect Id token will be placed. For this example, the following string would define these
 configurations: <code>OPENIDCONNECT|module|oidc|oidc_id_token_auth_target_header_key=oidc_id_token</
code>. In this case, 'oidc' is the name of the OpenID Connect authentication module created to
 authenticate OpenID Connect tokens. <br>When transforming a X509 Certificate, the Certificate
 module must be consumed, and the published rest-sts instance must be configured with the name of
 the Certificate module (or the service containing the module), and the header name configured for
 the Certificate module corresponding to where the Certificate module can expect to find the to-be-
validated Certificate. The following string would define these configurations: <code>X509|module|
cert_module|x509_token_auth_target_header_key=client_cert</code>. In this case 'cert_module' is the
 name of the Certificate module, and client_cert is the header name where Certificate module has been
 configured to find the client's Certificate.",

```

SaeModule

Realm Operations

Resource path: `/realm-config/authentication/modules/sae`

Resource version: `1.0`

create

Usage:

```
am> create SaeModule --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "authenticationLevel" : {
      "title" : "Authentication Level",
      "description" : "The authentication level associated with this module.<br><br>Each
 authentication module has an authentication level that can be used to indicate the level of security
 associated with the module; 0 is the lowest (and the default).",
      "propertyOrder" : 100,
      "required" : true,
      "type" : "integer",
      "exampleValue" : ""
    }
  }
}
```

delete

Usage:

```
am> delete SaeModule --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action SaeModule --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action SaeModule --realm Realm --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action SaeModule --realm Realm --actionName nextdescendents
```

query

Get the full list of instances of this collection. This query only supports `_queryFilter=true` filter.

Usage:

```
am> query SaeModule --realm Realm --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read SaeModule --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update SaeModule --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "authenticationLevel" : {
      "title" : "Authentication Level",
      "description" : "The authentication level associated with this module.<br><br>Each
 authentication module has an authentication level that can be used to indicate the level of security
 associated with the module; 0 is the lowest (and the default).",
      "propertyOrder" : 100,
      "required" : true,
      "type" : "integer",
      "exampleValue" : ""
    }
  }
}
```

Global Operations

Resource path: `/global-config/authentication/modules/sae`

Resource version: `1.0`

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action SaeModule --global --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action SaeModule --global --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action SaeModule --global --actionName nextdescendents
```

read

Usage:

```
am> read SaeModule --global
```

update

Usage:

```
am> update SaeModule --global --body body
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "defaults" : {
      "properties" : {
        "authenticationLevel" : {
          "title" : "Authentication Level",
          "description" : "The authentication level associated with this module.<br><br>Each
 authentication module has an authentication level that can be used to indicate the level of security
 associated with the module; 0 is the lowest (and the default).",
          "propertyOrder" : 100,
          "required" : true,
          "type" : "integer",
          "exampleValue" : ""
        }
      },
      "type" : "object",
      "title" : "Realm Defaults"
    }
  }
}
```

Saml2Entities

Realm Operations

This endpoint allows querying SAML2 entities configured in the system regardless of whether they are hosted or remote

Resource path: `/realm-config/saml2`

Resource version: `1.0`

query

Usage:

```
am> query Saml2Entities --realm Realm --filter filter
```

Parameters:

`--filter`

A CREST formatted query filter, where "true" will query all. Fields that can be queried: [*]

Saml2Entity

Realm Operations

Resource path: `/realm-config/federation/entityproviders/saml2`

Resource version: `1.0`

create

Usage:

```
am> create Saml2Entity --realm Realm --id id --body body
```

Parameters:

`--id`

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "metadata" : {
      "title" : "Metadata",
      "description" : "",
      "propertyOrder" : 100,
      "required" : true,
      "type" : "string",
      "exampleValue" : ""
    },
    "entityConfig" : {
      "title" : "Entity Configuration",
      "description" : "",
      "propertyOrder" : 200,
      "required" : true,
      "type" : "string",
      "exampleValue" : ""
    }
  }
}
```

delete

Usage:

```
am> delete Saml2Entity --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

query

Get the full list of instances of this collection. This query only supports `_queryFilter=true` filter.

Usage:

```
am> query Saml2Entity --realm Realm --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read Saml2Entity --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update Saml2Entity --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "metadata" : {
      "title" : "Metadata",
      "description" : "",

Saml2Module

Realm Operations

Resource path: `/realm-config/authentication/modules/authSaml`

Resource version: `1.0`

create

Usage:

```
am> create Saml2Module --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "authnContextDeclRef" : {
      "title" : "Authentication Context Declaration Reference",
      "description" : "(Optional) Use this parameter to specify authentication context declaration
 references. Separate multiple values with pipe characters (|).",
      "propertyOrder" : 800,
      "required" : true,
      "type" : "string",
      "exampleValue" : ""
    },
    "nameIdFormat" : {
      "title" : "NameID Format",
      "description" : "(Optional) Use this parameter to specify a SAML Name
 Identifier format identifier such as <pre>urn:oasis:names:tc:SAML:2.0:nameid-
format:persistent</pre> <pre>urn:oasis:names:tc:SAML:2.0:nameid-format:transient</pre>
 <pre>urn:oasis:names:tc:SAML:1.1:nameid-format:unspecified</pre>",
      "propertyOrder" : 1300,
      "required" : true,
      "type" : "string",
      "exampleValue" : ""
    },
    "reqBinding" : {
      "title" : "Request Binding",
      "description" : "Use this parameter to indicate what binding the SP should use when
 communicating with the IdP.",
      "propertyOrder" : 900,
      "required" : true,
```

```
      "type" : "string",
      "exampleValue" : ""
    },
    "sloEnabled" : {

   }
 }
```

```
}
```

delete

Usage:

```
am> delete Saml2Module --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action Saml2Module --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action Saml2Module --realm Realm --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action Saml2Module --realm Realm --actionName nextdescendents
```

query

Get the full list of instances of this collection. This query only supports `_queryFilter=true` filter.

Usage:

```
am> query Saml2Module --realm Realm --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read Saml2Module --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update Saml2Module --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "authnContextDeclRef" : {
      "title" : "Authentication Context Declaration Reference",

SamlV2ServiceConfiguration

Global Operations

Resource path: `/global-config/services/saml2`

Resource version: `1.0`

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action SamlV2ServiceConfiguration --global --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action SamlV2ServiceConfiguration --global --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action SamlV2ServiceConfiguration --global --actionName nextdescendents
```

read

Usage:

```
am> read SamlV2ServiceConfiguration --global
```

update

Usage:

```
am> update SamlV2ServiceConfiguration --global --body body
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",

```

SamlV2SoapBinding

Global Operations

Resource path: `/global-config/services/federation/saml2soapbinding`

Resource version: `1.0`

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action SamlV2SoapBinding --global --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action SamlV2SoapBinding --global --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action SamlV2SoapBinding --global --actionName nextdescendents
```

read

Usage:

```
am> read SamlV2SoapBinding --global
```

update

Usage:

```
am> update SamlV2SoapBinding --global --body body
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "requestHandlers" : {
      "title" : "Request Handler List",
      "description" : "List of handlers to deal with SAML v2.0 requests bound to SOAP. <p><p>The
 required format is: <code>key=<em>Meta Alias</em>|class=<em>Handler Class</em></code> <p><p>Set
 the <em>key</em> property for a request handler to the meta alias, and the <em>class</em>
 property to the name of the class that implements the handler.<p><p> For example: <code>key=/pdp|
class=com.sun.identity.xacml.plugins.XACMLAuthzDecisionQueryHandler</code>",
      "propertyOrder" : 100,
      "required" : true,
      "items" : {
        "type" : "string"
      },
      "type" : "array",
      "exampleValue" : ""
    }
  }
}
```

ScriptStore

Realm Operations

Resource path: `/realm-config/services/scripts`

Resource version: `1.0`

create

Usage:

```
am> create ScriptStore --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "lastModifiedDate" : {
      "title" : "Last modification date",
```

```
     "description" : "A string containing the last modified date and time, in ISO 8601 format. If
the script has not been modified since it was created, this property will have the same value as
creationDate",
     "propertyOrder" : 1000,
     "required" : true,
     "type" : "string",
     "exampleValue" : ""
   },
   "language" : {
     "title" : "Script language",
     "description" : "The language the script is written in - JAVASCRIPT or GROOVY",
     "propertyOrder" : 1000,
     "required" : true,
     "type" : "string",
     "exampleValue" : ""
   },
   "script" : {
     "title" : "Script",
     "description" : "The source code of the script. The source code is in UTF-8 format and encoded
into Base64",
     "propertyOrder" : 1000,
     "required" : true,
     "type" : "string",
     "exampleValue" : ""
   },
   "createdBy" : {
     "title" : "Created by",
     "description" : "A string containing the universal identifier DN of the subject that created the
script",
     "propertyOrder" : 1000,
     "required" : true,
     "type" : "string",
     "exampleValue" : ""
   },
   "lastModifiedBy" : {
     "title" : "Last modifier",
     "description" : "A string containing the universal identifier DN of the subject that most
recently updated the script. If the script has not been modified since it was created, this property
will have the same value as createdBy",
     "propertyOrder" : 1000,
     "required" : true,
     "type" : "string",
     "exampleValue" : ""
   },
   "name" : {
     "title" : "Script name",
     "description" : "The name provided for the script",
     "propertyOrder" : 1000,
     "required" : true,
     "type" : "string",
     "exampleValue" : ""
   },
   "description" : {
     "title" : "Script description",
     "description" : "An optional text string to help identify the script",
     "propertyOrder" : 1000,
     "required" : true,
     "type" : "string",
     "exampleValue" : ""
```

```
    },
    "creationDate" : {
      "title" : "Creation date",
      "description" : "An integer containing the creation date and time, in ISO 8601 format",
      "propertyOrder" : 1000,
      "required" : true,
      "type" : "string",
      "exampleValue" : ""
    },
    "context" : {
      "title" : "Script type",
      "description" : "The script type. Supported values are: POLICY_CONDITION : Policy Condition
 AUTHENTICATION_SERVER_SIDE : Server-side Authentication  AUTHENTICATION_CLIENT_SIDE : Client-side
 Authentication - Note Client-side scripts must be written in JavaScript OIDC_CLAIMS : OIDC Claims
 SOCIAL_IDP_PROFILE_TRANSFORMATION : Social Identity Provider Profile Transformation",
      "propertyOrder" : 1000,
      "required" : true,
      "type" : "string",
      "exampleValue" : ""
    }
  }
}
```

delete

Usage:

```
am> delete ScriptStore --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action ScriptStore --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action ScriptStore --realm Realm --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action ScriptStore --realm Realm --actionName nextdescendents
```

query

Get the full list of instances of this collection. This query only supports `_queryFilter=true` filter.

Usage:

```
am> query ScriptStore --realm Realm --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read ScriptStore --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update ScriptStore --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "lastModifiedDate" : {
      "title" : "Last modification date",

    }
  }
}
```

ScriptTypes

Global Operations

Resource path: `/global-config/services/scripting/contexts`

Resource version: `1.0`

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action ScriptTypes --global --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action ScriptTypes --global --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action ScriptTypes --global --actionName nextdescendents
```

query

Get the full list of instances of this collection. This query only supports `_queryFilter=true` filter.

Usage:

```
am> query ScriptTypes --global --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read ScriptTypes --global --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update ScriptTypes --global --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "defaultScript" : {
      "title" : "Default Script",
      "description" : "The source code that is presented as the default when creating a new script of
 this type.",
      "propertyOrder" : 1200,
      "required" : true,
      "type" : "string",
      "exampleValue" : ""
    },
    "languages" : {
      "title" : "Scripting languages",
      "description" : "The language the script is written in.<br><br>This is used to determine how to
 validate the script, as well as which engine to run the script within.",
      "propertyOrder" : 1100,
      "required" : true,
      "items" : {
        "type" : "string"
      },
      "type" : "array",
      "exampleValue" : ""
    }
  }
}
```

ScriptedDecision

Realm Operations

Resource path: `/realm-config/authentication/authenticationtrees/nodes/ScriptedDecisionNode`

Resource version: `1.0`

create

Usage:

```
am> create ScriptedDecision --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "outcomes" : {
      "title" : "Outcomes",
      "description" : "",
      "propertyOrder" : 200,
      "items" : {
        "type" : "string"
      },
      "type" : "array",
      "exampleValue" : ""
    },
    "inputs" : {
      "title" : "Script Inputs",
      "description" : "A list of state inputs required by the script.",
      "propertyOrder" : 300,
      "items" : {
        "type" : "string"
      },
      "type" : "array",
      "exampleValue" : ""
    },
    "script" : {
      "title" : "Script",
      "description" : "The script to evaluate.",

        "type" : "string"
      },
      "type" : "array",
      "exampleValue" : ""
    }
  },
  "required" : [ "script", "outputs", "inputs", "outcomes" ]
}
```

delete

Usage:

```
am> delete ScriptedDecision --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action ScriptedDecision --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action ScriptedDecision --realm Realm --actionName getCreatableTypes
```

listOutcomes

List the available outcomes for the node type.

Usage:

```
am> action ScriptedDecision --realm Realm --body body --actionName listOutcomes
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "title" : "Some configuration of the node. This does not need to be complete against the
 configuration schema."
}
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action ScriptedDecision --realm Realm --actionName nextdescendents
```

query

Get the full list of instances of this collection. This query only supports `_queryFilter=true` filter.

Usage:

```
am> query ScriptedDecision --realm Realm --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read ScriptedDecision --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update ScriptedDecision --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "outcomes" : {
      "title" : "Outcomes",
```

```
      "description" : "",
      "propertyOrder" : 200,
      "items" : {
        "type" : "string"
      },
      "type" : "array",
      "exampleValue" : ""
    },
    "inputs" : {
      "title" : "Script Inputs",
      "description" : "A list of state inputs required by the script.",
      "propertyOrder" : 300,
      "items" : {
        "type" : "string"
      },
      "type" : "array",
      "exampleValue" : ""
    },
    "script" : {
      "title" : "Script",
      "description" : "The script to evaluate.",
      "propertyOrder" : 100,
      "type" : "string",
      "exampleValue" : ""
    },
    "outputs" : {
      "title" : "Script Outputs",
      "description" : "A list of state outputs produced by the script.",
      "propertyOrder" : 400,
      "items" : {
        "type" : "string"
      },
      "type" : "array",
      "exampleValue" : ""
    }
  },
  "required" : [ "script", "outputs", "inputs", "outcomes" ]
}
```

ScriptedModule

Realm Operations

Resource path: `/realm-config/authentication/modules/scripted`

Resource version: `1.0`

create

Usage:

```
am> create ScriptedModule --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "clientScript" : {
      "title" : "Client-side Script",
      "description" : "The client-side script.",
      "propertyOrder" : 200,
      "required" : true,
      "type" : "string",
      "exampleValue" : ""
    },
    "authenticationLevel" : {
      "title" : "Authentication Level",
      "description" : "The authentication level associated with the authentication module.<br><br>Each
 authentication module has an authentication level that can be used to indicate the level of security
 associated with the module; 0 is the lowest (and the default).",
      "propertyOrder" : 400,
      "required" : true,
      "type" : "integer",
      "exampleValue" : ""
    },
    "clientScriptEnabled" : {
      "title" : "Client-side Script Enabled",
      "description" : "Enable this setting if the client-side script should be executed.",
      "propertyOrder" : 100,
      "required" : true,
      "type" : "boolean",
      "exampleValue" : ""
    },
    "serverScript" : {
      "title" : "Server-side Script",
      "description" : "The server-side script to execute.<br><br>This script will be run on the
 server, subsequent to any client script having returned.",
      "propertyOrder" : 300,
      "required" : true,
      "type" : "string",
      "exampleValue" : ""
    }
  }
}
```

delete

Usage:

```
am> delete ScriptedModule --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action ScriptedModule --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action ScriptedModule --realm Realm --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action ScriptedModule --realm Realm --actionName nextdescendents
```

query

Get the full list of instances of this collection. This query only supports `_queryFilter=true` filter.

Usage:

```
am> query ScriptedModule --realm Realm --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read ScriptedModule --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update ScriptedModule --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "clientScript" : {
      "title" : "Client-side Script",
      "description" : "The client-side script.",
      "propertyOrder" : 200,
      "required" : true,
      "type" : "string",
      "exampleValue" : ""
    },
    "authenticationLevel" : {
      "title" : "Authentication Level",
      "description" : "The authentication level associated with the authentication module.<br><br>Each
 authentication module has an authentication level that can be used to indicate the level of security
 associated with the module; 0 is the lowest (and the default).",
      "propertyOrder" : 400,
      "required" : true,
      "type" : "integer",
      "exampleValue" : ""
    },
    "clientScriptEnabled" : {
      "title" : "Client-side Script Enabled",
      "description" : "Enable this setting if the client-side script should be executed.",
      "propertyOrder" : 100,
```

```
      "required" : true,
      "type" : "boolean",
      "exampleValue" : ""
    },
    "serverScript" : {
      "title" : "Server-side Script",
      "description" : "The server-side script to execute.<br><br>This script will be run on the
 server, subsequent to any client script having returned.",
      "propertyOrder" : 300,
      "required" : true,
      "type" : "string",
      "exampleValue" : ""
    }
  }
}
```

Global Operations

Resource path: `/global-config/authentication/modules/scripted`

Resource version: `1.0`

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action ScriptedModule --global --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action ScriptedModule --global --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action ScriptedModule --global --actionName nextdescendents
```

read

Usage:

```
am> read ScriptedModule --global
```

update

Usage:

```
am> update ScriptedModule --global --body body
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "defaults" : {
      "properties" : {
        "clientScript" : {
          "title" : "Client-side Script",
          "description" : "The client-side script.",
          "propertyOrder" : 200,
          "required" : true,
          "type" : "string",
          "exampleValue" : ""
        },
        "serverScript" : {
          "title" : "Server-side Script",
          "description" : "The server-side script to execute.<br><br>This script will be run on the
 server, subsequent to any client script having returned.",
          "propertyOrder" : 300,
          "required" : true,
          "type" : "string",
          "exampleValue" : ""
        },
        "authenticationLevel" : {
          "title" : "Authentication Level",
          "description" : "The authentication level associated with the authentication
 module.<br><br>Each authentication module has an authentication level that can be used to indicate
 the level of security associated with the module; 0 is the lowest (and the default).",
          "propertyOrder" : 400,
          "required" : true,
          "type" : "integer",
          "exampleValue" : ""
        },
        "clientScriptEnabled" : {
          "title" : "Client-side Script Enabled",
          "description" : "Enable this setting if the client-side script should be executed.",
          "propertyOrder" : 100,
          "required" : true,
          "type" : "boolean",
          "exampleValue" : ""
```

```
        }
      },
      "type" : "object",
      "title" : "Realm Defaults"
    }
  }
}
```

Scripting

Global Operations

Resource path: `/global-config/services/scripting`

Resource version: `1.0`

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action Scripting --global --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action Scripting --global --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action Scripting --global --actionName nextdescendents
```

read

Usage:

```
am> read Scripting --global
```

update

Usage:

```
am> update Scripting --global --body body
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "defaultContext" : {
      "title" : "Default Script Type",
      "description" : "The default script context type when creating a new script.",
      "propertyOrder" : 900,
      "required" : true,
      "type" : "string",
      "exampleValue" : ""
    }
  }
}
```

ScriptingEngineConfiguration

Global Operations

Resource path: `/global-config/services/scripting/contexts/{contexts}/engineConfiguration`

Resource version: `1.0`

create

Usage:

```
am> create ScriptingEngineConfiguration --global --contexts contexts --body body
```

Parameters:

--contexts

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "idleTimeout" : {
      "title" : "Thread idle timeout (seconds)",
      "description" : "Length of time (in seconds) to wait before terminating threads.<br><br>Length
of time (in seconds) to wait before terminating threads that were started when the queue reached
capacity. Only applies to threads beyond the core pool size (up to the maximum size).",
      "propertyOrder" : 500,
      "required" : true,

      "required" : true,
      "type" : "integer",
      "exampleValue" : ""
    }
  }
}
```

delete

Usage:

```
am> delete ScriptingEngineConfiguration --global --contexts contexts
```

Parameters:

--contexts

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action ScriptingEngineConfiguration --global --contexts contexts --actionName getAllTypes
```

Parameters:

--contexts

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action ScriptingEngineConfiguration --global --contexts contexts --actionName getCreatableTypes
```

Parameters:

--contexts

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action ScriptingEngineConfiguration --global --contexts contexts --actionName nextdescendents
```

Parameters:

--contexts

read

Usage:

```

}
```

Scripts

Realm Operations

The script resources service is responsible for managing scripts used for client-side and server-side scripted authentication, custom policy conditions, and handling OpenID Connect claims. Scripts are represented in JSON and take the following form. Scripts are built from standard JSON objects and values (strings, numbers, objects, sets, arrays, true, false, and null). Each script has a system-generated universally unique identifier (UUID), which must be used when modifying existing scripts. Renaming a script will not affect the UUID

Resource path: `/scripts`

Resource version: `1.1`

create

Create a script in a realm. The value for script must be in UTF-8 format and then encoded into Base64.

Usage:

```
am> create Scripts --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "description" : "Script resource endpoint json schema",
  "type" : "object",
  "title" : "Script resource schema",
  "properties" : {
    "_id" : {
      "title" : "Script unique ID",
      "description" : "A unique ID for a script configuration, provided by the server",
      "type" : "string"
    },
    "name" : {
      "title" : "Script name",
      "description" : "The name provided for the script",
      "type" : "string"
    },
    "description" : {
      "title" : "Script description",
      "description" : "An optional text string to help identify the script",
      "type" : "string"
    },
    "script" : {
      "title" : "Script",
      "description" : "The source code of the script. The source code is in UTF-8 format and encoded
 into Base64",
      "type" : "string"
    },
    "language" : {
      "title" : "Script language",
      "description" : "The language the script is written in - JAVASCRIPT or GROOVY",
      "type" : "string"
    },
    "context" : {
      "title" : "Script type",
      "description" : "The script type. Supported values are: POLICY_CONDITION : Policy Condition
 AUTHENTICATION_SERVER_SIDE : Server-side Authentication  AUTHENTICATION_CLIENT_SIDE : Client-side
 Authentication - Note Client-side scripts must be written in JavaScript OIDC_CLAIMS : OIDC Claims",
```

```
      "type" : "string"
    },
    "createdBy" : {
      "title" : "Created by",
      "description" : "A string containing the universal identifier DN of the subject that created the
 script",
      "type" : "string"
    },
    "creationDate" : {
      "title" : "Creation date",
      "description" : "An integer containing the creation date and time, in ISO 8601 format",
      "type" : "number"
    },
    "lastModifiedBy" : {
      "title" : "Last modifier",
      "description" : "A string containing the universal identifier DN of the subject that most
 recently updated the script. If the script has not been modified since it was created, this property
 will have the same value as createdBy",
      "type" : "string"
    },
    "lastModifiedDate" : {
      "title" : "Last modification date",
      "description" : "A string containing the last modified date and time, in ISO 8601 format. If
 the script has not been modified since it was created, this property will have the same value as
 creationDate",
      "type" : "number"
    }
  },
  "required" : [ "name", "description", "script", "language", "context" ]
}
```

delete

Delete an individual script in a realm specified by the UUID parameter

Usage:

```
am> delete Scripts --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

query

List all the scripts in a realm, as well as any global scripts

Usage:

```
am> query Scripts --realm Realm --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all. Fields that can be queried: [*]

read

Read an individual script in a realm by specifying the UUID parameter

Usage:

```
am> read Scripts --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Update an individual script in a realm specified by the UUID parameter

Usage:

```
am> update Scripts --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "description" : "Script resource endpoint json schema",
  "type" : "object",
  "title" : "Script resource schema",
  "properties" : {
    "_id" : {
      "title" : "Script unique ID",
      "description" : "A unique ID for a script configuration, provided by the server",
      "type" : "string"
    },
    "name" : {
      "title" : "Script name",
      "description" : "The name provided for the script",
      "type" : "string"
    },
    "description" : {
      "title" : "Script description",
      "description" : "An optional text string to help identify the script",
      "type" : "string"
    },
```

```
    "script" : {
      "title" : "Script",
      "description" : "The source code of the script. The source code is in UTF-8 format and encoded
 into Base64",
      "type" : "string"
    },
    "language" : {
      "title" : "Script language",
      "description" : "The language the script is written in - JAVASCRIPT or GROOVY",
      "type" : "string"
    },
    "context" : {
      "title" : "Script type",
      "description" : "The script type. Supported values are: POLICY_CONDITION : Policy Condition
 AUTHENTICATION_SERVER_SIDE : Server-side Authentication  AUTHENTICATION_CLIENT_SIDE : Client-side
 Authentication - Note Client-side scripts must be written in JavaScript OIDC_CLAIMS : OIDC Claims",
      "type" : "string"
    },
    "createdBy" : {
      "title" : "Created by",
      "description" : "A string containing the universal identifier DN of the subject that created the
 script",
      "type" : "string"
    },
    "creationDate" : {
      "title" : "Creation date",
      "description" : "An integer containing the creation date and time, in ISO 8601 format",
      "type" : "number"
    },
    "lastModifiedBy" : {
      "title" : "Last modifier",
      "description" : "A string containing the universal identifier DN of the subject that most
 recently updated the script. If the script has not been modified since it was created, this property
 will have the same value as createdBy",
      "type" : "string"
    },
    "lastModifiedDate" : {
      "title" : "Last modification date",
      "description" : "A string containing the last modified date and time, in ISO 8601 format. If
 the script has not been modified since it was created, this property will have the same value as
 creationDate",
      "type" : "number"
    }
  },
  "required" : [ "name", "description", "script", "language", "context" ]
}
```

validate

Validate a script. Include a JSON representation of the script and the script language, JAVASCRIPT or GROOVY, in the POST data. The value for script must be in UTF-8 format and then encoded into Base64

Usage:

```
am> action Scripts --realm Realm --body body --actionName validate
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "description" : "Validate action request schema",
  "type" : "object",
  "title" : "Validate request schema",
  "properties" : {
    "script" : {
      "title" : "Script",
      "description" : "The source code of the script. The source code is in UTF-8 format and encoded
 into Base64",
      "type" : "string"
    },
    "language" : {
      "title" : "Script language",
      "description" : "The language the script is written in - JAVASCRIPT or GROOVY",
      "type" : "string"
    }
  },
  "required" : [ "script", "language" ]
}
```

SdkProperties

Global Operations

An object of property key-value pairs

Resource path: `/global-config/servers/{serverName}/properties/sdk`

Resource version: `1.0`

read

Usage:

```
am> read SdkProperties --global --serverName serverName
```

Parameters:

--serverName

An object of property key-value pairs

update

Usage:

```
am> update SdkProperties --global --serverName serverName --body body
```

Parameters:

--serverName

An object of property key-value pairs

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "amconfig.header.datastore" : {
      "title" : "Data Store",
      "type" : "object",
      "propertyOrder" : 0,
      "properties" : {

}
```

SecretStores

Realm Operations

Services that provide sources of secret values

Resource path: `/realm-config/secrets/stores`

Resource version: `1.0`

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action SecretStores --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action SecretStores --realm Realm --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action SecretStores --realm Realm --actionName nextdescendents
```

Global Operations

Services that provide sources of secret values

Resource path: `/global-config/secrets/stores`

Resource version: `1.0`

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action SecretStores --global --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action SecretStores --global --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action SecretStores --global --actionName nextdescendents
```

Secrets

Realm Operations

Secrets represent cryptographic values such as private keys

Resource path: `/realm-config/secrets`

Resource version: `1.0`

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action Secrets --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action Secrets --realm Realm --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action Secrets --realm Realm --actionName nextdescendents
```

Global Operations

Secrets represent cryptographic values such as private keys

Resource path: `/global-config/secrets`

Resource version: `1.0`

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action Secrets --global --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action Secrets --global --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action Secrets --global --actionName nextdescendents
```

SecurID

Realm Operations

Resource path: `/realm-config/authentication/modules/securid`

Resource version: `1.0`

create

Usage:

```
am> create SecurID --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "serverConfigPath" : {
      "title" : "ACE/Server Configuration Path",
      "description" : "The path to the ACE/Server configuration files",
      "propertyOrder" : null,
      "required" : true,
      "type" : "string",
      "exampleValue" : ""
    },
    "authenticationLevel" : {
      "title" : "Authentication Level",
      "description" : "The authentication level associated with this module.<br><br>Each
 authentication module has an authentication level that can be used to indicate the level of security
 associated with the module; 0 is the lowest (and the default). ",
      "propertyOrder" : null,
      "required" : true,
      "type" : "integer",
      "exampleValue" : ""
    }
  }
}
```

delete

Usage:

```
am> delete SecurID --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action SecurID --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action SecurID --realm Realm --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action SecurID --realm Realm --actionName nextdescendents
```

query

Get the full list of instances of this collection. This query only supports `_queryFilter=true` filter.

Usage:

```
am> query SecurID --realm Realm --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read SecurID --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update SecurID --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "serverConfigPath" : {
      "title" : "ACE/Server Configuration Path",
      "description" : "The path to the ACE/Server configuration files",
      "propertyOrder" : null,
      "required" : true,
      "type" : "string",
      "exampleValue" : ""
    },
    "authenticationLevel" : {
      "title" : "Authentication Level",
      "description" : "The authentication level associated with this module.<br><br>Each
 authentication module has an authentication level that can be used to indicate the level of security
 associated with the module; 0 is the lowest (and the default). ",
      "propertyOrder" : null,
      "required" : true,
      "type" : "integer",
      "exampleValue" : ""
    }
  }
}
```

Global Operations

Resource path: `/global-config/authentication/modules/securid`

Resource version: `1.0`

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action SecurID --global --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action SecurID --global --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action SecurID --global --actionName nextdescendents
```

read

Usage:

```
am> read SecurID --global
```

update

Usage:

```
am> update SecurID --global --body body
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "defaults" : {
      "properties" : {
        "authenticationLevel" : {
          "title" : "Authentication Level",
          "description" : "The authentication level associated with this module.<br><br>Each
 authentication module has an authentication level that can be used to indicate the level of security
 associated with the module; 0 is the lowest (and the default). ",
          "propertyOrder" : null,
          "required" : true,
          "type" : "integer",
          "exampleValue" : ""
        },
        "serverConfigPath" : {
          "title" : "ACE/Server Configuration Path",
          "description" : "The path to the ACE/Server configuration files",
          "propertyOrder" : null,
          "required" : true,
          "type" : "string",
          "exampleValue" : ""
        }
      },
      "type" : "object",
      "title" : "Realm Defaults"
    }
  }
}
```

SecurityProperties

Global Operations

An object of property key-value pairs

Resource path: `/global-config/servers/{serverName}/properties/security`

Resource version: `1.0`

read

Usage:

```
am> read SecurityProperties --global --serverName serverName
```

Parameters:

`--serverName`

An object of property key-value pairs

update

Usage:

```
am> update SecurityProperties --global --serverName serverName --body body
```

Parameters:

--serverName

An object of property key-value pairs

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "amconfig.header.encryption" : {
      "title" : "Encryption",

SecurityTokenServices

Realm Operations

Security Token Services configuration

Resource path: `/realm-config/services/sts`

Resource version: `1.0`

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action SecurityTokenServices --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action SecurityTokenServices --realm Realm --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action SecurityTokenServices --realm Realm --actionName nextdescendents
```

SelectIdentityProvider

Realm Operations

Resource path: `/realm-config/authentication/authenticationtrees/nodes/SelectIdPNode`

Resource version: `1.0`

create

Usage:

```
am> create SelectIdentityProvider --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "passwordAttribute" : {
      "title" : "Password attribute",
      "description" : "The attribute in the user object that verifies that user during local
 authentication.",
      "propertyOrder" : 300,
      "type" : "string",
      "exampleValue" : ""
    },
    "includeLocalAuthentication" : {
      "title" : "Include local authentication",
      "description" : "Whether local authentication will be included as an available identity
 provider.",
      "propertyOrder" : 100,
      "type" : "boolean",
      "exampleValue" : ""
    },
    "identityAttribute" : {
      "title" : "Identity Attribute",
      "description" : "The attribute used to retrieve an existing user. Required to support the offer
 of only existing providers.",
      "propertyOrder" : 500,
      "type" : "string",
      "exampleValue" : ""
    },
    "offerOnlyExisting" : {
      "title" : "Offer only existing providers",
      "description" : "Choices offered should be limited to those already associated with a user
 object.",
      "propertyOrder" : 200,
      "type" : "boolean",
      "exampleValue" : ""
```

```
    }
  },
  "required" : [ "offerOnlyExisting", "identityAttribute", "includeLocalAuthentication",
 "passwordAttribute" ]
}
```

delete

Usage:

```
am> delete SelectIdentityProvider --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action SelectIdentityProvider --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action SelectIdentityProvider --realm Realm --actionName getCreatableTypes
```

listOutcomes

List the available outcomes for the node type.

Usage:

```
am> action SelectIdentityProvider --realm Realm --body body --actionName listOutcomes
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "title" : "Some configuration of the node. This does not need to be complete against the
 configuration schema."
}
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action SelectIdentityProvider --realm Realm --actionName nextdescendents
```

query

Get the full list of instances of this collection. This query only supports `_queryFilter=true` filter.

Usage:

```
am> query SelectIdentityProvider --realm Realm --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read SelectIdentityProvider --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update SelectIdentityProvider --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "passwordAttribute" : {
      "title" : "Password attribute",
      "description" : "The attribute in the user object that verifies that user during local
 authentication.",
      "propertyOrder" : 300,
      "type" : "string",
      "exampleValue" : ""
    },
    "includeLocalAuthentication" : {
      "title" : "Include local authentication",
      "description" : "Whether local authentication will be included as an available identity
 provider.",
      "propertyOrder" : 100,
      "type" : "boolean",
      "exampleValue" : ""
    },
    "identityAttribute" : {
      "title" : "Identity Attribute",
      "description" : "The attribute used to retrieve an existing user. Required to support the offer
 of only existing providers.",
      "propertyOrder" : 500,
      "type" : "string",
      "exampleValue" : ""
    },
    "offerOnlyExisting" : {
      "title" : "Offer only existing providers",
      "description" : "Choices offered should be limited to those already associated with a user
 object.",
      "propertyOrder" : 200,
      "type" : "boolean",
      "exampleValue" : ""
    }
  },
  "required" : [ "offerOnlyExisting", "identityAttribute", "includeLocalAuthentication",
 "passwordAttribute" ]
}
```

SelfServiceTreeConfig

Realm Operations

Resource path: `/realm-config/services/selfServiceTrees`

Resource version: `1.0`

create

Usage:

```
am> create SelfServiceTreeConfig --realm Realm --body body
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "treeMapping" : {
      "title" : "Tree Mapping",
      "description" : "Maps the self service function name (the key) to an Authentication Tree (the
 value).",
      "propertyOrder" : 100,
      "required" : true,
      "patternProperties" : {
        ".*" : {
          "type" : "string"
        }
      },
      "type" : "object",
      "exampleValue" : ""
    },
    "enabled" : {
      "title" : "Enabled",
      "description" : "",
      "propertyOrder" : 90,
      "required" : true,
      "type" : "boolean",
      "exampleValue" : ""
    }
  }
}
```

delete

Usage:

```
am> delete SelfServiceTreeConfig --realm Realm
```

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action SelfServiceTreeConfig --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action SelfServiceTreeConfig --realm Realm --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action SelfServiceTreeConfig --realm Realm --actionName nextdescendents
```

read

Usage:

```
am> read SelfServiceTreeConfig --realm Realm
```

update

Usage:

```
am> update SelfServiceTreeConfig --realm Realm --body body
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "treeMapping" : {
      "title" : "Tree Mapping",
      "description" : "Maps the self service function name (the key) to an Authentication Tree (the
 value).",
      "propertyOrder" : 100,
      "required" : true,
      "patternProperties" : {
        ".*" : {
          "type" : "string"
        }
      },
      "type" : "object",
      "exampleValue" : ""
    },
    "enabled" : {
      "title" : "Enabled",
      "description" : "",
      "propertyOrder" : 90,
      "required" : true,
      "type" : "boolean",
      "exampleValue" : ""
    }
  }
}
```

SelfServiceTrees

Realm Operations

Self Service Tree resource contains a mapping between self service and authentication trees.

Resource path: `/selfservice/trees`

Resource version: `1.0`

read

Read the configured tree mapping.

Usage:

```
am> read SelfServiceTrees --realm Realm
```

Global Operations

Resource path: `/global-config/services/selfServiceTrees`

Resource version: `1.0`

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action SelfServiceTrees --global --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action SelfServiceTrees --global --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action SelfServiceTrees --global --actionName nextdescendents
```

read

Usage:

```
am> read SelfServiceTrees --global
```

update

Usage:

```
am> update SelfServiceTrees --global --body body
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
```

```
  "properties" : {
    "defaults" : {
      "properties" : {
        "enabled" : {
          "title" : "Enabled",
          "description" : "",
          "propertyOrder" : 90,
          "required" : true,
          "type" : "boolean",
          "exampleValue" : ""
        },
        "treeMapping" : {
          "title" : "Tree Mapping",
          "description" : "Maps the self service function name (the key) to an Authentication Tree
 (the value).",
          "propertyOrder" : 100,
          "required" : true,
          "patternProperties" : {
            ".*" : {
              "type" : "string"
            }
          },
          "type" : "object",
          "exampleValue" : ""
        }
      },
      "type" : "object",
      "title" : "Realm Defaults"
    }
  }
}
```

ServerInformation

Realm Operations

Provides information about the server.

Resource path: `/serverinfo`

Resource version: `1.1`

read

Read the server information.

Usage:

```
am> read ServerInformation --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

ServerVersion

Realm Operations

Server Version schema

Resource path: `/serverinfo/version`

Resource version: `1.0`

read

It returns information about OpenAM such as: version, revision and date

Usage:

```
am> read ServerVersion --realm Realm
```

Servers

Global Operations

Servers resource provider is responsible for managing Servers and their configuration for an OpenAM instance.

Resource path: `/global-config/servers`

Resource version: `1.0`

clone

Clone the specified Server, keeping it's settings but using a different URL.

Usage:

```
am> action Servers --global --body body --actionName clone
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "$schema" : "http://json-schema.org/draft-04/schema#",
  "description" : "Container for required data to clone a Server.",
  "type" : "object",
  "title" : "Clone Server Request schema",
  "properties" : {
    "clonedUrl" : {
      "type" : "string",
      "title" : "Cloned Server URL",
      "description" : "The new URL of the cloned server. Must be unique."
    }
  }
}
```

create

Create a Server.

Usage:

```
am> create Servers --global --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "$schema" : "http://json-schema.org/draft-04/schema#",
  "description" : "Describes the data that a Server Resource could contain.",
  "type" : "object",
  "title" : "Server resource schema",
  "properties" : {
    "_id" : {
      "type" : "string",
      "title" : "Server id",
      "description" : "Unique identifier of the Server."
    },
    "siteName" : {
      "type" : "string",
      "title" : "Site name",
      "description" : "The Server's name."
    },
    "url" : {
      "type" : "string",
      "title" : "Url",
      "description" : "The URL of the Server."
    }
  }
}
```

delete

Delete a Server.

Usage:

```
am> delete Servers --global --id id
```

Parameters:

--id

The unique identifier for the resource.

query

Query the collection of the Servers.

Usage:

```
am> query Servers --global --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all. Fields that can be queried: [*]

read

Read a Server.

Usage:

```
am> read Servers --global --id id
```

Parameters:

--id

The unique identifier for the resource.

Services

Realm Operations

The collection of services available on a realm.

Resource path: `/realm-config/services`

Resource version: `1.0`

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action Services --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action Services --realm Realm --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action Services --realm Realm --actionName nextdescendents
```

query

Find services provisioned for the realm - query for a particular service by identifier, or request all services using `_queryFilter=true`

Usage:

```
am> query Services --realm Realm --filter filter
```

Parameters:

`--filter`

A CREST formatted query filter, where "true" will query all. Fields that can be queried: [_id]

Global Operations

Global and default configuration for services

Resource path: `/global-config/services`

Resource version: `1.0`

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action Services --global --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action Services --global --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action Services --global --actionName nextdescendents
```

Session

Realm Operations

Resource path: `/realm-config/services/session`

Resource version: `1.0`

create

Usage:

```
am> create Session --realm Realm --body body
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
```

```
   "dynamic" : {
     "properties" : {
       "maxSessionTime" : {
         "title" : "Maximum Session Time",
         "description" : "Maximum time a session can remain valid before OpenAM requires the user to
 authenticate again, in minutes.",
         "propertyOrder" : 100,
         "required" : true,
         "type" : "integer",
         "exampleValue" : ""
       },
       "maxIdleTime" : {
         "title" : "Maximum Idle Time",
         "description" : "Maximum time a CTS-based session can remain idle before OpenAM requires the
 user to authenticate again, in minutes.",
         "propertyOrder" : 200,
         "required" : true,
         "type" : "integer",
         "exampleValue" : ""
       },
       "quotaLimit" : {
         "title" : "Active User Sessions",
         "description" : "Maximum number of concurrent CTS-based sessions OpenAM allows a user to
 have.",
         "propertyOrder" : 800,
         "required" : true,
         "type" : "integer",
         "exampleValue" : ""
       },
       "maxCachingTime" : {
         "title" : "Maximum Caching Time",
         "description" : "Maximum time that external clients of AM are recommended to cache the
 session for, in minutes.",
         "propertyOrder" : 300,
         "required" : true,
         "type" : "integer",
         "exampleValue" : ""
       }
     },
     "type" : "object",
     "title" : "Dynamic Attributes"
   }
 }
}
```

delete

Usage:

```
am> delete Session --realm Realm
```

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action Session --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action Session --realm Realm --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action Session --realm Realm --actionName nextdescendents
```

read

Usage:

```
am> read Session --realm Realm
```

update

Usage:

```
am> update Session --realm Realm --body body
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "dynamic" : {
      "properties" : {
        "maxSessionTime" : {
          "title" : "Maximum Session Time",
          "description" : "Maximum time a session can remain valid before OpenAM requires the user to
 authenticate again, in minutes.",
          "propertyOrder" : 100,
          "required" : true,
          "type" : "integer",
          "exampleValue" : ""
        },
```

```
        "maxIdleTime" : {
          "title" : "Maximum Idle Time",
          "description" : "Maximum time a CTS-based session can remain idle before OpenAM requires the
 user to authenticate again, in minutes.",
          "propertyOrder" : 200,
          "required" : true,
          "type" : "integer",
          "exampleValue" : ""
        },
        "quotaLimit" : {
          "title" : "Active User Sessions",
          "description" : "Maximum number of concurrent CTS-based sessions OpenAM allows a user to
 have.",
          "propertyOrder" : 800,
          "required" : true,
          "type" : "integer",
          "exampleValue" : ""
        },
        "maxCachingTime" : {
          "title" : "Maximum Caching Time",
          "description" : "Maximum time that external clients of AM are recommended to cache the
 session for, in minutes.",
          "propertyOrder" : 300,
          "required" : true,
          "type" : "integer",
          "exampleValue" : ""
        }
      },
      "type" : "object",
      "title" : "Dynamic Attributes"
    }
  }
}
```

Global Operations

Resource path: `/global-config/services/session`

Resource version: `1.0`

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action Session --global --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action Session --global --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action Session --global --actionName nextdescendents
```

read

Usage:

```
am> read Session --global
```

update

Usage:

```
am> update Session --global --body body
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "stateless" : {
      "type" : "object",
      "title" : "Client-based Sessions",
      "propertyOrder" : 4,
      "properties" : {
        "statelessCompressionType" : {
          "title" : "Compression Algorithm",
          "description" : "If enabled the session state is compressed before signing and
 encryption.<br><br><strong>WARNING</strong>: Enabling compression may compromise encryption. This may
 leak information about the content of the session state if encryption is enabled.",
          "propertyOrder" : 2500,
          "required" : true,
          "type" : "string",

          "required" : true,
          "type" : "string",
          "exampleValue" : ""
        },
        "statelessEncryptionType" : {
          "title" : "Encryption Algorithm",
          "description" : "Specifies the algorithm that AM uses to encrypt the JSON Web
 Token (JWT) containing the session content.<br><br>AM supports the following encryption
 algorithms:<ul><li><strong>NONE</strong>. No encryption is selected.</li><li><strong>RSA</
strong>. Session content is encrypted with AES using a unique key. The key is then encrypted
 with an RSA public key and appended to the JWT.<p><p>AM supports the following padding modes,
 which you can set using the <code>org.forgerock.openam.session.stateless.rsa.padding</code>
 advanced property:<ul><li><code>RSA1_5</code>. RSA with PKCS#1 v1.5 padding.</li><li><code>RSA-
OAEP</code>. RSA with optimal asymmetric encryption padding (OAEP) and SHA-1.</li><li><code>RSA-
OAEP-256</code>. RSA with OAEP padding and SHA-256.</li></ul></li><li><strong>AES KeyWrapping</
strong>. Session content is encrypted with AES using a unique key and is then wrapped using AES
 KeyWrap and the master key. This provides additional security, compared to RSA, at the cost
 of 128 or 256 bits (or 32 bytes) depending on the size of the master key. This method provides
 authenticated encryption, which removes the need for a separate signature and decreases the
 byte size of the JWT. See <a href=\"https://tools.ietf.org/html/rfc3394\" target=\"_blank\">RFC
```

```
 3394</a>.</li><li><strong>Direct AES Encryption</strong>.  Session content is encrypted with
 direct AES encryption with a symmetric key. This method provides authenticated encryption,
 which removes the need for a separate signature and decreases the byte size of the JWT. </li></
ul><p><p><strong>Important</strong>: To prevent users from accidentally disabling all authentication
 support, which can be accomplished by disabling signing and not using an authenticated encryption
 mode, you must set the <code>org.forgerock.openam.session.stateless.signing.allownone</code> system
 property to <code>true</code> to turn off signing completely.",
          "propertyOrder" : 2200,
          "required" : true,
          "type" : "string",

SessionProperties

Global Operations

An object of property key-value pairs

Resource path: `/global-config/servers/{serverName}/properties/session`

Resource version: `1.0`

read

Usage:

```
am> read SessionProperties --global --serverName serverName
```

Parameters:

`--serverName`

An object of property key-value pairs

update

Usage:

```
am> update SessionProperties --global --serverName serverName --body body
```

Parameters:

--serverName

An object of property key-value pairs

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "amconfig.header.sessionthresholds" : {
      "title" : "Session Limits",

      "required" : true,
      "items" : {
        "type" : "string"
      },
      "type" : "array",
      "exampleValue" : ""
    }
  }
}
```

delete

Usage:

```
am> delete SessionPropertyWhiteList --realm Realm
```

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action SessionPropertyWhiteList --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action SessionPropertyWhiteList --realm Realm --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action SessionPropertyWhiteList --realm Realm --actionName nextdescendents
```

read

Usage:

```
am> read SessionPropertyWhiteList --realm Realm
```

update

Usage:

```
am> update SessionPropertyWhiteList --realm Realm --body body
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "whitelistedQueryProperties" : {
      "title" : "Session Properties to return for session queries",
      "description" : "A list of session properties that can be returned to admins in a REST session
 query response.<p><p>This setting may impact REST query performance - when session properties are
 added, the CTS token must be retrieved, and will be the subject of decryption and decompression, if
 configured.<p><p> Protected attributes will NOT be allowed to be set, edited or deleted, even if they
 are included in this list.",
      "propertyOrder" : 110,
      "required" : true,
      "items" : {
        "type" : "string"
      },
      "type" : "array",
      "exampleValue" : ""
    },
    "sessionPropertyWhitelist" : {
      "title" : "Whitelisted Session Property Names",
      "description" : "A list of properties that users may read, edit the value of, or delete from
 their session.<p><p> Adding properties to sessions can impact OpenAM's performance. Because there is
 no size constraint limiting the set of properties that you can add to sessions, and no limit on the
 number of session properties you can add, keep in mind that adding session properties can increase
 the load on an OpenAM deployment in the following areas: <ul><li>OpenAM server memory</li><li>OpenDJ
 storage</li><li>OpenDJ replication</li></ul><p>Protected attributes will NOT be allowed to be set,
 edited or deleted, even if they are included in this whitelist.",
      "propertyOrder" : 100,
      "required" : true,
      "items" : {
        "type" : "string"
      },
      "type" : "array",
      "exampleValue" : ""
    }
  }
}
```

Global Operations

Resource path: `/global-config/services/amSessionPropertyWhitelist`

Resource version: `1.0`

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action SessionPropertyWhiteList --global --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action SessionPropertyWhiteList --global --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action SessionPropertyWhiteList --global --actionName nextdescendents
```

read

Usage:

```
am> read SessionPropertyWhiteList --global
```

update

Usage:

```
am> update SessionPropertyWhiteList --global --body body
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "defaults" : {
      "properties" : {
        "sessionPropertyWhitelist" : {
          "title" : "Whitelisted Session Property Names",
          "description" : "A list of properties that users may read, edit the value of, or delete from
 their session.<p><p> Adding properties to sessions can impact OpenAM's performance. Because there is
 no size constraint limiting the set of properties that you can add to sessions, and no limit on the
 number of session properties you can add, keep in mind that adding session properties can increase
 the load on an OpenAM deployment in the following areas: <ul><li>OpenAM server memory</li><li>OpenDJ
 storage</li><li>OpenDJ replication</li></ul><p>Protected attributes will NOT be allowed to be set,
 edited or deleted, even if they are included in this whitelist.",
```

```
          "propertyOrder" : 100,
          "required" : true,
          "items" : {
            "type" : "string"
          },
          "type" : "array",
          "exampleValue" : ""
        },
        "whitelistedQueryProperties" : {
          "title" : "Session Properties to return for session queries",
          "description" : "A list of session properties that can be returned to admins in a REST
 session query response.<p><p>This setting may impact REST query performance - when session properties
 are added, the CTS token must be retrieved, and will be the subject of decryption and decompression,

          },
          "type" : "array",
          "exampleValue" : ""
        }
      },
      "type" : "object",
      "title" : "Realm Defaults"
    }
  }
}
```

SessionUserService

Realm Operations

Resource path: `/users/{user}/services/session`

Resource version: `1.0`

create

Usage:

```
am> create SessionUserService --realm Realm --body body
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "iplanet-am-session-quota-limit" : {
      "title" : "Active User Sessions",
      "description" : "Maximum number of concurrent CTS-based sessions OpenAM allows a user to have.",
      "propertyOrder" : 800,
      "required" : true,
      "type" : "integer",
      "exampleValue" : ""
    },
    "iplanet-am-session-max-caching-time" : {
      "title" : "Maximum Caching Time",
      "description" : "Maximum time that external clients of AM are recommended to cache the session
 for, in minutes.",
      "propertyOrder" : 300,
      "required" : true,
      "type" : "integer",
      "exampleValue" : ""
    },
    "iplanet-am-session-max-session-time" : {
      "title" : "Maximum Session Time",
      "description" : "Maximum time a session can remain valid before OpenAM requires the user to
 authenticate again, in minutes.",
      "propertyOrder" : 100,
      "required" : true,
      "type" : "integer",
      "exampleValue" : ""
    },
    "iplanet-am-session-max-idle-time" : {
      "title" : "Maximum Idle Time",
      "description" : "Maximum time a CTS-based session can remain idle before OpenAM requires the
 user to authenticate again, in minutes.",
      "propertyOrder" : 200,
      "required" : true,
      "type" : "integer",
      "exampleValue" : ""
    }
  }
}
```

delete

Usage:

```
am> delete SessionUserService --realm Realm
```

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action SessionUserService --realm Realm --user user --actionName getAllTypes
```

Parameters:

--user

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action SessionUserService --realm Realm --user user --actionName getCreatableTypes
```

Parameters:

--user

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action SessionUserService --realm Realm --user user --actionName nextdescendents
```

Parameters:

--user

read

Usage:

```
am> read SessionUserService --realm Realm
```

unassignServices

action.unassignServices.description

Usage:

```
am> action SessionUserService --realm Realm --body body --user user --actionName unassignServices
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "description" : "i18n:api-descriptor/UserServicesResource#schema.description",
  "type" : "object",
  "title" : "i18n:api-descriptor/UserServicesResource#schema.title",
  "properties" : {
    "serviceNames" : {
      "type" : "array",
      "title" : "i18n:api-descriptor/UserServicesResource#schema.servicename.title",
      "description" : "i18n:api-descriptor/UserServicesResource#schema.servicename.description",
      "items" : {
        "type" : "string"
      }
    }
  }
}
```

--user

update

Usage:

```
am> update SessionUserService --realm Realm --body body
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "iplanet-am-session-quota-limit" : {
      "title" : "Active User Sessions",
      "description" : "Maximum number of concurrent CTS-based sessions OpenAM allows a user to have.",
      "propertyOrder" : 800,
      "required" : true,
      "type" : "integer",
      "exampleValue" : ""
    },
    "iplanet-am-session-max-caching-time" : {
      "title" : "Maximum Caching Time",
      "description" : "Maximum time that external clients of AM are recommended to cache the session
 for, in minutes.",
      "propertyOrder" : 300,
      "required" : true,
      "type" : "integer",
```

```
      "exampleValue" : ""
    },
    "iplanet-am-session-max-session-time" : {
      "title" : "Maximum Session Time",
      "description" : "Maximum time a session can remain valid before OpenAM requires the user to
 authenticate again, in minutes.",
      "propertyOrder" : 100,
      "required" : true,
      "type" : "integer",
      "exampleValue" : ""
    },
    "iplanet-am-session-max-idle-time" : {
      "title" : "Maximum Idle Time",
      "description" : "Maximum time a CTS-based session can remain idle before OpenAM requires the
 user to authenticate again, in minutes.",
      "propertyOrder" : 200,
      "required" : true,
      "type" : "integer",
      "exampleValue" : ""
    }
  }
}
```

Sessions

Realm Operations

Represents Sessions that can queried via a REST interface.

Resource path: `/sessions`

Resource version: `4.0`

getSessionInfo

It reads and returns the information about the requested session.

Usage:

```
am> action Sessions --realm Realm --body body --actionName getSessionInfo
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "$schema" : "http://json-schema.org/draft-04/schema#",
  "description" : "Action request",
  "title" : "Action request",
  "type" : "object",
  "properties" : {
    "tokenId" : {
      "title" : "The tokenId",
      "description" : "The tokenId of the user you requests information for",
      "type" : "string"
    }
  },
  "required" : [ "tokenId" ]
}
```

getSessionInfoAndResetIdleTime

It reads and returns the information about the requested session. It also resets the session idle time.

Usage:

```
am> action Sessions --realm Realm --body body --actionName getSessionInfoAndResetIdleTime
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "$schema" : "http://json-schema.org/draft-04/schema#",
  "description" : "Action request",
  "title" : "Action request",
  "type" : "object",
  "properties" : {
    "tokenId" : {
      "title" : "The tokenId",
      "description" : "The tokenId of the user you requests information for",
      "type" : "string"
    }
  },
  "required" : [ "tokenId" ]
}
```

getSessionProperties

It reads and returns all of the whitelisted properties for the requested session.

Usage:

```
am> action Sessions --realm Realm --body body --actionName getSessionProperties
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "$schema" : "http://json-schema.org/draft-04/schema#",
  "description" : "Action request",
  "title" : "Action request",
  "type" : "object",
  "properties" : {
    "tokenId" : {
      "title" : "The tokenId",
      "description" : "The tokenId of the user you requests information for",
      "type" : "string"
    }
  },
  "required" : [ "tokenId" ]
}
```

logout

It does logout from OpenAM

Usage:

```
am> action Sessions --realm Realm --body body --actionName logout
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "$schema" : "http://json-schema.org/draft-04/schema#",
  "description" : "Action request",
  "title" : "Action request",
  "type" : "object",
  "properties" : {
    "tokenId" : {
      "title" : "The tokenId",
      "description" : "The tokenId of the user you requests information for",
      "type" : "string"
    }
  },
  "required" : [ "tokenId" ]
}
```

logoutByHandle

It logs out sessions based on the provided session handles.

Usage:

```
am> action Sessions --realm Realm --body body --actionName logoutByHandle
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "$schema" : "http://json-schema.org/draft-04/schema#",
  "description" : "Logout By Handle request",
  "type" : "object",
  "title" : "Logout By Handle request",
  "properties" : {
    "sessionHandles" : {
      "title" : "Session handles",
      "description" : "The array of session handles that needs to be invalidated.",
      "type" : "array",
      "items" : {
        "type" : "string"
      }
    }
  },
  "required" : [ "sessionHandles" ]
}
```

query

It queries all sessions using the provided query filter.

Usage:

```
am> query Sessions --realm Realm --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all. Fields that can be queried: [username, realm]

refresh

Suggests to OpenAM that it should refresh this session (update it's latest access time and reset its idleTime to 0). This will only be obeyed if the time between the session's previous latest access time and now is greater than the value configured for the server's Latest Access Time Update Frequency setting, which defaults to 60 seconds.

Usage:

```
am> action Sessions --realm Realm --body body --actionName refresh
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "$schema" : "http://json-schema.org/draft-04/schema#",
  "description" : "Action request",
  "title" : "Action request",
  "type" : "object",
  "properties" : {
    "tokenId" : {
      "title" : "The tokenId",
      "description" : "The tokenId of the user you requests information for",
      "type" : "string"
    }
  },
  "required" : [ "tokenId" ]
}
```

updateSessionProperties

It updates and returns all of the whitelisted properties for the requested session.

Usage:

```
am> action Sessions --realm Realm --body body --actionName updateSessionProperties
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "$schema" : "http://json-schema.org/draft-04/schema#",
  "description" : "Action request",
  "title" : "Action request",
  "type" : "object",
  "properties" : {
    "tokenId" : {
      "title" : "The tokenId",
      "description" : "The tokenId of the user you requests information for",
      "type" : "string"
    }
  },
  "required" : [ "tokenId" ]
}
```

validate

It checks that the specified SSO Token Id is valid or not. If there is any problem getting or validating the token which causes an exception the json response will be false. In addition if the token is expired then the json response will be set to false. Otherwise it will be set to true.

Usage:

```
am> action Sessions --realm Realm --body body --actionName validate
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "$schema" : "http://json-schema.org/draft-04/schema#",
  "description" : "Action request",
  "title" : "Action request",
  "type" : "object",
  "properties" : {
    "tokenId" : {
      "title" : "The tokenId",
      "description" : "The tokenId of the user you requests information for",
      "type" : "string"
    }
  },
  "required" : [ "tokenId" ]
}
```

SetPersistentCookie

Realm Operations

Resource path: `/realm-config/authentication/authenticationtrees/nodes/SetPersistentCookieNode`

Resource version: `1.0`

create

Usage:

```
am> create SetPersistentCookie --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
```

```
  "type" : "object",
  "properties" : {
    "useSecureCookie" : {
      "title" : "Use Secure Cookie",
      "description" : "Sets the persistent cookie as \"Secure\".",
      "propertyOrder" : 300,
      "type" : "boolean",
      "exampleValue" : ""
    },
    "hmacSigningKey" : {
      "title" : "HMAC Signing Key",
      "description" : "Base64-encoded 256-bit key to use for HMAC signing of the cookie.",
      "propertyOrder" : 500,
      "type" : "string",
      "format" : "password",
      "exampleValue" : ""
    },
    "useHttpOnlyCookie" : {
      "title" : "Use HTTP Only Cookie",
      "description" : "Sets the persistent cookie as \"HttpOnly\".",
      "propertyOrder" : 400,
      "type" : "boolean",
      "exampleValue" : ""
    },
    "idleTimeout" : {
      "title" : "Idle Timeout",
      "description" : "The maximum idle time between requests before the cookie is invalidated, in
 hours.",
      "propertyOrder" : 100,
      "type" : "integer",
      "exampleValue" : ""
    },
    "maxLife" : {
      "title" : "Max Life",
      "description" : "The maximum length of time the persistent cookie is valid for, in hours.",
      "propertyOrder" : 200,
      "type" : "integer",
      "exampleValue" : ""
    },
    "persistentCookieName" : {
      "title" : "Persistent Cookie Name",
      "description" : "Sets the name of the persistent cookie.",
      "propertyOrder" : 600,
      "type" : "string",
      "exampleValue" : ""
    }
  },
  "required" : [ "maxLife", "useSecureCookie", "useHttpOnlyCookie", "idleTimeout", "hmacSigningKey",
 "persistentCookieName" ]
}
```

delete

Usage:

```
am> delete SetPersistentCookie --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action SetPersistentCookie --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action SetPersistentCookie --realm Realm --actionName getCreatableTypes
```

listOutcomes

List the available outcomes for the node type.

Usage:

```
am> action SetPersistentCookie --realm Realm --body body --actionName listOutcomes
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "title" : "Some configuration of the node. This does not need to be complete against the
 configuration schema."
}
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action SetPersistentCookie --realm Realm --actionName nextdescendents
```

query

Get the full list of instances of this collection. This query only supports `_queryFilter=true` filter.

Usage:

```
am> query SetPersistentCookie --realm Realm --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read SetPersistentCookie --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update SetPersistentCookie --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "useSecureCookie" : {
      "title" : "Use Secure Cookie",
      "description" : "Sets the persistent cookie as \"Secure\".",
```

```
      "propertyOrder" : 300,
      "type" : "boolean",
      "exampleValue" : ""
    },
    "hmacSigningKey" : {
      "title" : "HMAC Signing Key",
      "description" : "Base64-encoded 256-bit key to use for HMAC signing of the cookie.",
      "propertyOrder" : 500,
      "type" : "string",
      "format" : "password",
      "exampleValue" : ""
    },
    "useHttpOnlyCookie" : {
      "title" : "Use HTTP Only Cookie",
      "description" : "Sets the persistent cookie as \"HttpOnly\".",
      "propertyOrder" : 400,
      "type" : "boolean",
      "exampleValue" : ""
    },
    "idleTimeout" : {
      "title" : "Idle Timeout",
      "description" : "The maximum idle time between requests before the cookie is invalidated, in
 hours.",
      "propertyOrder" : 100,
      "type" : "integer",
      "exampleValue" : ""
    },
    "maxLife" : {
      "title" : "Max Life",
      "description" : "The maximum length of time the persistent cookie is valid for, in hours.",
      "propertyOrder" : 200,
      "type" : "integer",
      "exampleValue" : ""
    },
    "persistentCookieName" : {
      "title" : "Persistent Cookie Name",
      "description" : "Sets the name of the persistent cookie.",
      "propertyOrder" : 600,
      "type" : "string",
      "exampleValue" : ""
    }
  },
  "required" : [ "maxLife", "useSecureCookie", "useHttpOnlyCookie", "idleTimeout", "hmacSigningKey",
 "persistentCookieName" ]
}
```

SetSessionProperties

Realm Operations

Resource path: `/realm-config/authentication/authenticationtrees/nodes/SetSessionPropertiesNode`

Resource version: `1.0`

create

Usage:

```
am> create SetSessionProperties --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "properties" : {
      "title" : "Properties",
      "description" : "The properties to set on the user's session if/when it is created.",
      "propertyOrder" : 100,
      "patternProperties" : {
        ".*" : {
          "type" : "string"
        }
      },
      "type" : "object",
      "exampleValue" : ""
    }
  },
  "required" : [ "properties" ]
}
```

delete

Usage:

```
am> delete SetSessionProperties --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action SetSessionProperties --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action SetSessionProperties --realm Realm --actionName getCreatableTypes
```

listOutcomes

List the available outcomes for the node type.

Usage:

```
am> action SetSessionProperties --realm Realm --body body --actionName listOutcomes
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "title" : "Some configuration of the node. This does not need to be complete against the
 configuration schema."
}
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action SetSessionProperties --realm Realm --actionName nextdescendents
```

query

Get the full list of instances of this collection. This query only supports `_queryFilter=true` filter.

Usage:

```
am> query SetSessionProperties --realm Realm --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read SetSessionProperties --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update SetSessionProperties --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "properties" : {
      "title" : "Properties",
      "description" : "The properties to set on the user's session if/when it is created.",
      "propertyOrder" : 100,
      "patternProperties" : {
        ".*" : {
          "type" : "string"
        }
      },
      "type" : "object",
      "exampleValue" : ""
    }
  },
  "required" : [ "properties" ]
}
```

SharedAgents

Realm Operations

Agents handler that is responsible for managing agents

Resource path: `/realm-config/agents/SharedAgent`

Resource version: `1.0`

create

Usage:

```
am> create SharedAgents --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "userpassword" : {
      "title" : "Password",
      "description" : "",
      "propertyOrder" : 100,
      "required" : true,
      "type" : "string",
      "format" : "password",
      "exampleValue" : ""
    },
    "status" : {
      "title" : "Status",
      "description" : "Status of the agent configuration.",
      "propertyOrder" : 200,
      "type" : "object",
      "exampleValue" : "",
      "properties" : {
        "inherited" : {
          "type" : "boolean",
          "required" : true
        },
        "value" : {
          "type" : "string",
          "required" : true
```

```
        }
      }
    },
    "agentProfilesAllowedToRead" : {
      "title" : "Agent Profiles allowed to Read.",
      "description" : "",
      "propertyOrder" : 22600,
      "items" : {
        "type" : "string"
      },
      "type" : "object",
      "exampleValue" : "",
      "properties" : {
        "inherited" : {
          "type" : "boolean",
          "required" : true
        },
        "value" : {
          "type" : "array",
          "required" : true
        }
      }
    },
    "cdssoRootUrl" : {
      "title" : "Agent Root URL for CDSSO",
      "description" : "The agent root URL for CDSSO. The valid value is in the following format:
 <br>protocol://hostname:port/<br> The protocol represents the protocol used, such as http or https.
 The hostname represents the host name of the machine on which the agent resides. The port represents
 the port number on which the agent is installed. The slash following the port number is required.",
      "propertyOrder" : 22700,
      "items" : {
        "type" : "string"
      },
      "type" : "object",
      "exampleValue" : "",
      "properties" : {
        "inherited" : {
          "type" : "boolean",
          "required" : true
        },
        "value" : {
          "type" : "array",
          "required" : true
        }
      }
    }
  }
}
```

delete

Usage:

```
am> delete SharedAgents --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action SharedAgents --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action SharedAgents --realm Realm --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action SharedAgents --realm Realm --actionName nextdescendents
```

query

Querying the agents of a specific type

Usage:

```
am> query SharedAgents --realm Realm --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read SharedAgents --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update SharedAgents --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "userpassword" : {
      "title" : "Password",
      "description" : "",
      "propertyOrder" : 100,
      "required" : true,
      "type" : "string",
      "format" : "password",
      "exampleValue" : ""
    },
    "status" : {
      "title" : "Status",
      "description" : "Status of the agent configuration.",
      "propertyOrder" : 200,
      "type" : "object",
      "exampleValue" : "",
      "properties" : {
        "inherited" : {
          "type" : "boolean",
          "required" : true
        },
        "value" : {
          "type" : "string",
          "required" : true
        }
      }
    },
    "agentProfilesAllowedToRead" : {
      "title" : "Agent Profiles allowed to Read.",
      "description" : "",
```

```
      "propertyOrder" : 22600,
      "items" : {
        "type" : "string"
      },
      "type" : "object",
      "exampleValue" : "",
      "properties" : {
        "inherited" : {
          "type" : "boolean",
          "required" : true
        },
        "value" : {
          "type" : "array",
          "required" : true
        }
      }
    },
    "cdssoRootUrl" : {
      "title" : "Agent Root URL for CDSSO",
      "description" : "The agent root URL for CDSSO. The valid value is in the following format:
 <br>protocol://hostname:port/<br> The protocol represents the protocol used, such as http or https.
 The hostname represents the host name of the machine on which the agent resides. The port represents
 the port number on which the agent is installed. The slash following the port number is required.",
      "propertyOrder" : 22700,
      "items" : {
        "type" : "string"
      },
      "type" : "object",
      "exampleValue" : "",
      "properties" : {
        "inherited" : {
          "type" : "boolean",
          "required" : true
        },
        "value" : {
          "type" : "array",
          "required" : true
        }
      }
    }
  }
}
```

Sites

Global Operations

This version 1.0 sites service represents a Sites resource with CQ operations on the users collection and CRUDPA operations available for the site item. Items can have server version 1.0 subresources.

Resource path: `/global-config/sites`

Resource version: `1.0`

create

Create new site entry

Usage:

```
am> create Sites --global --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "$schema" : "http://json-schema.org/draft-04/schema#",
  "description" : "Site schema.",
  "type" : "object",
  "title" : "Site schema",
  "properties" : {
    "_id" : {
      "type" : "string",
      "title" : "Name",
      "description" : "Site name."
    },
    "id" : {
      "type" : "string",
      "title" : "Site id",
      "description" : "Site's unique identifier.",
      "javaName" : "siteId"
    },
    "url" : {
      "type" : "string",
      "title" : "Primary URL",
      "description" : "Site primary URL."
    },
    "secondaryURLs" : {
      "type" : "array",
      "title" : "Secondary URLs",
      "description" : "Secondary URLs for this site.",
      "items" : {
        "type" : "string"
      }
    },
    "servers" : {
      "type" : "array",
      "title" : "Assigned Servers",
      "description" : "Servers assigned to this site.",
      "items" : {
        "type" : "object",
        "properties" : {
          "id" : {
            "type" : "string",
```

```
            "title" : "Server id",
            "description" : "Server's unique identifier for the site."
          },
          "url" : {
            "type" : "string",
            "title" : "Server URL",
            "description" : "Server URL of the site"
          }
        }
      }
    }
  }
}
```

delete

Delete site entry

Usage:

```
am> delete Sites --global --id id
```

Parameters:

--id

The unique identifier for the resource.

query

Query the collection of site entries

Usage:

```
am> query Sites --global --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all. Fields that can be queried: [_id, url]

read

Read a site entry

Usage:

```
am> read Sites --global --id id
```

Parameters:

--id

The unique identifier for the resource.

schema

Sites schema action that returns the sites schema json

Usage:

```
am> action Sites --global --actionName schema
```

template

Sites template action that returns a template json object for site insert

Usage:

```
am> action Sites --global --actionName template
```

update

Update a site entry

Usage:

```
am> update Sites --global --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "$schema" : "http://json-schema.org/draft-04/schema#",
  "description" : "Site schema.",
  "type" : "object",
  "title" : "Site schema",
  "properties" : {
    "_id" : {
      "type" : "string",
      "title" : "Name",
      "description" : "Site name."
    },
    "id" : {
      "type" : "string",
      "title" : "Site id",
      "description" : "Site's unique identifier.",
```

```
      "javaName" : "siteId"
    },
    "url" : {
      "type" : "string",
      "title" : "Primary URL",
      "description" : "Site primary URL."
    },
    "secondaryURLs" : {
      "type" : "array",
      "title" : "Secondary URLs",
      "description" : "Secondary URLs for this site.",
      "items" : {
        "type" : "string"
      }
    },
    "servers" : {
      "type" : "array",
      "title" : "Assigned Servers",
      "description" : "Servers assigned to this site.",
      "items" : {
        "type" : "object",
        "properties" : {
          "id" : {
            "type" : "string",
            "title" : "Server id",
            "description" : "Server's unique identifier for the site."
          },
          "url" : {
            "type" : "string",
            "title" : "Server URL",
            "description" : "Server URL of the site"
          }
        }
      }
    }
  }
}
```

SoapSTSAgentGroups

Realm Operations

Agent Groups handler that is responsible for managing agent groups

Resource path: `/realm-config/agents/groups/SoapSTSAgent`

Resource version: `1.0`

create

Usage:

```
am> create SoapSTSAgentGroups --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "publishServicePollInterval" : {
      "title" : "Poll Interval",
      "description" : "Interval, in seconds, to poll the sts publish service for newly-published SOAP
 STS instances.",
      "propertyOrder" : 26300,
      "required" : true,
      "type" : "integer",
      "exampleValue" : ""
    }
  }
}
```

delete

Usage:

```
am> delete SoapSTSAgentGroups --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action SoapSTSAgentGroups --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action SoapSTSAgentGroups --realm Realm --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action SoapSTSAgentGroups --realm Realm --actionName nextdescendents
```

query

Querying the agent groups of a specific type

Usage:

```
am> query SoapSTSAgentGroups --realm Realm --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read SoapSTSAgentGroups --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update SoapSTSAgentGroups --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "publishServicePollInterval" : {
      "title" : "Poll Interval",
      "description" : "Interval, in seconds, to poll the sts publish service for newly-published SOAP
 STS instances.",
      "propertyOrder" : 26300,
      "required" : true,
      "type" : "integer",
      "exampleValue" : ""
    }
  }
}
```

SoapStsAgents

Realm Operations

Agents handler that is responsible for managing agents

Resource path: `/realm-config/agents/SoapSTSAgent`

Resource version: `1.0`

create

Usage:

```
am> create SoapStsAgents --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "publishServicePollInterval" : {
      "title" : "Poll Interval",
```

```
      "description" : "Interval, in seconds, to poll the sts publish service for newly-published SOAP
 STS instances.",
      "propertyOrder" : 26300,
      "type" : "object",
      "exampleValue" : "",
      "properties" : {
        "inherited" : {
          "type" : "boolean",
          "required" : true
        },
        "value" : {
          "type" : "integer",
          "required" : true
        }
      }
    },
    "agentgroup" : {
      "title" : "Group",
      "description" : "Add the agent to a group to allow inheritance of property values from the
 group. <br>Changing the group will update inherited property values. <br>Inherited property values
 are copied to the agent.",
      "propertyOrder" : 50,
      "required" : false,
      "type" : "string",
      "exampleValue" : ""
    },
    "userpassword" : {
      "title" : "Password",
      "description" : "",
      "propertyOrder" : 100,
      "required" : true,
      "type" : "string",
      "format" : "password",
      "exampleValue" : ""
    }
  }
}
```

delete

Usage:

```
am> delete SoapStsAgents --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action SoapStsAgents --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action SoapStsAgents --realm Realm --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action SoapStsAgents --realm Realm --actionName nextdescendents
```

query

Querying the agents of a specific type

Usage:

```
am> query SoapStsAgents --realm Realm --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read SoapStsAgents --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update SoapStsAgents --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "publishServicePollInterval" : {
      "title" : "Poll Interval",
      "description" : "Interval, in seconds, to poll the sts publish service for newly-published SOAP
 STS instances.",
      "propertyOrder" : 26300,
      "type" : "object",
      "exampleValue" : "",
      "properties" : {
        "inherited" : {
          "type" : "boolean",
          "required" : true
        },
        "value" : {
          "type" : "integer",
          "required" : true
        }
      }
    },
    "agentgroup" : {
      "title" : "Group",
      "description" : "Add the agent to a group to allow inheritance of property values from the
 group. <br>Changing the group will update inherited property values. <br>Inherited property values
 are copied to the agent.",
      "propertyOrder" : 50,

      "type" : "string",
      "exampleValue" : ""
    },
    "userpassword" : {
      "title" : "Password",
      "description" : "",
      "propertyOrder" : 100,
      "required" : true,
      "type" : "string",
      "format" : "password",
      "exampleValue" : ""
    }
  }
}
```

SocialAuthInstagramModule

Realm Operations

Resource path: `/realm-config/authentication/modules/authSocialInstagram`

Resource version: `1.0`

create

Usage:

```
am> create SocialAuthInstagramModule --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "core" : {
      "type" : "object",
      "title" : "Core",

    }
  }
}
```

delete

Usage:

```
am> delete SocialAuthInstagramModule --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action SocialAuthInstagramModule --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action SocialAuthInstagramModule --realm Realm --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action SocialAuthInstagramModule --realm Realm --actionName nextdescendents
```

query

Get the full list of instances of this collection. This query only supports `_queryFilter=true` filter.

Usage:

```
am> query SocialAuthInstagramModule --realm Realm --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read SocialAuthInstagramModule --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update SocialAuthInstagramModule --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "core" : {
      "type" : "object",

Global Operations

Resource path: `/global-config/authentication/modules/authSocialInstagram`

Resource version: `1.0`

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action SocialAuthInstagramModule --global --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action SocialAuthInstagramModule --global --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action SocialAuthInstagramModule --global --actionName nextdescendents
```

read

Usage:

```
am> read SocialAuthInstagramModule --global
```

update

Usage:

```
am> update SocialAuthInstagramModule --global --body body
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "defaults" : {
      "properties" : {

SocialAuthOAuth2Module

Realm Operations

Resource path: `/realm-config/authentication/modules/authSocialOAuth2`

Resource version: `1.0`

create

Usage:

```
am> create SocialAuthOAuth2Module --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "accountProvisioning" : {
      "type" : "object",
      "title" : "Account Provisioning",
      "propertyOrder" : 1,

```

```
    }
  }
}
```

delete

Usage:

```
am> delete SocialAuthOAuth2Module --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action SocialAuthOAuth2Module --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action SocialAuthOAuth2Module --realm Realm --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action SocialAuthOAuth2Module --realm Realm --actionName nextdescendents
```

query

Get the full list of instances of this collection. This query only supports `_queryFilter=true` filter.

Usage:

```
am> query SocialAuthOAuth2Module --realm Realm --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read SocialAuthOAuth2Module --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update SocialAuthOAuth2Module --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "accountProvisioning" : {

Global Operations

Resource path: `/global-config/authentication/modules/authSocialOAuth2`

Resource version: `1.0`

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action SocialAuthOAuth2Module --global --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action SocialAuthOAuth2Module --global --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action SocialAuthOAuth2Module --global --actionName nextdescendents
```

read

Usage:

```
am> read SocialAuthOAuth2Module --global
```

update

Usage:

```
am> update SocialAuthOAuth2Module --global --body body
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "defaults" : {
      "properties" : {

SocialAuthOpenIDModule

Realm Operations

Resource path: `/realm-config/authentication/modules/authSocialOpenID`

Resource version: `1.0`

create

Usage:

```
am> create SocialAuthOpenIDModule --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "core" : {
      "type" : "object",

```

```
}
```

delete

Usage:

```
am> delete SocialAuthOpenIDModule --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action SocialAuthOpenIDModule --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action SocialAuthOpenIDModule --realm Realm --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action SocialAuthOpenIDModule --realm Realm --actionName nextdescendents
```

query

Get the full list of instances of this collection. This query only supports `_queryFilter=true` filter.

Usage:

```
am> query SocialAuthOpenIDModule --realm Realm --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read SocialAuthOpenIDModule --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update SocialAuthOpenIDModule --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "core" : {
      "type" : "object",

Global Operations

Resource path: `/global-config/authentication/modules/authSocialOpenID`

Resource version: `1.0`

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action SocialAuthOpenIDModule --global --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action SocialAuthOpenIDModule --global --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action SocialAuthOpenIDModule --global --actionName nextdescendents
```

read

Usage:

```
am> read SocialAuthOpenIDModule --global
```

update

Usage:

```
am> update SocialAuthOpenIDModule --global --body body
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "defaults" : {
      "properties" : {

SocialAuthTwitterModule

Realm Operations

Resource path: `/realm-config/authentication/modules/authSocialTwitter`

Resource version: `1.0`

create

Usage:

```
am> create SocialAuthTwitterModule --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "core" : {
      "type" : "object",
      "title" : "Core",

}
```

delete

Usage:

```
am> delete SocialAuthTwitterModule --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action SocialAuthTwitterModule --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action SocialAuthTwitterModule --realm Realm --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action SocialAuthTwitterModule --realm Realm --actionName nextdescendents
```

query

Get the full list of instances of this collection. This query only supports `_queryFilter=true` filter.

Usage:

```
am> query SocialAuthTwitterModule --realm Realm --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read SocialAuthTwitterModule --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update SocialAuthTwitterModule --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",

```

Global Operations

Resource path: `/global-config/authentication/modules/authSocialTwitter`

Resource version: `1.0`

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action SocialAuthTwitterModule --global --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action SocialAuthTwitterModule --global --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action SocialAuthTwitterModule --global --actionName nextdescendents
```

read

Usage:

```
am> read SocialAuthTwitterModule --global
```

update

Usage:

```
am> update SocialAuthTwitterModule --global --body body
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```

SocialAuthVKontakteModule

Realm Operations

Resource path: `/realm-config/authentication/modules/authSocialVk`

Resource version: `1.0`

create

Usage:

```
am> create SocialAuthVKontakteModule --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "core" : {
      "type" : "object",
      "title" : "Core",
      "propertyOrder" : 0,
      "properties" : {
        "scope" : {
          "title" : "Scope",
          "description" : "OAuth scope; list of user profile properties<br><br>According to the OAuth
 2.0 Authorization Framework, scope is a space-separated list of user profile attributes that the
 client application requires. The list depends on the permissions that the resource owner grants to
 the client application.<br/><br/> Some authorization servers use non-standard separators for scopes.
 For example, Facebook takes a comma-separated list.<br/><br/>",

```

delete

Usage:

```
am> delete SocialAuthVKontakteModule --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action SocialAuthVKontakteModule --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action SocialAuthVKontakteModule --realm Realm --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action SocialAuthVKontakteModule --realm Realm --actionName nextdescendents
```

query

Get the full list of instances of this collection. This query only supports `_queryFilter=true` filter.

Usage:

```
am> query SocialAuthVKontakteModule --realm Realm --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read SocialAuthVKontakteModule --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update SocialAuthVKontakteModule --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "core" : {
      "type" : "object",
      "title" : "Core",

Global Operations

Resource path: `/global-config/authentication/modules/authSocialVk`

Resource version: `1.0`

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action SocialAuthVKontakteModule --global --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action SocialAuthVKontakteModule --global --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action SocialAuthVKontakteModule --global --actionName nextdescendents
```

read

Usage:

```
am> read SocialAuthVKontakteModule --global
```

update

Usage:

```
am> update SocialAuthVKontakteModule --global --body body
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{

SocialAuthWeChatMobileModule

Realm Operations

Resource path: `/realm-config/authentication/modules/authSocialWeChatMobile`

Resource version: `1.0`

create

Usage:

```
am> create SocialAuthWeChatMobileModule --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
```

```
 "properties" : {
   "emailSettings" : {
     "type" : "object",
     "title" : "Email",

      }
    }
  }
}
```

delete

Usage:

```
am> delete SocialAuthWeChatMobileModule --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action SocialAuthWeChatMobileModule --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action SocialAuthWeChatMobileModule --realm Realm --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action SocialAuthWeChatMobileModule --realm Realm --actionName nextdescendents
```

query

Get the full list of instances of this collection. This query only supports `_queryFilter=true` filter.

Usage:

```
am> query SocialAuthWeChatMobileModule --realm Realm --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read SocialAuthWeChatMobileModule --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update SocialAuthWeChatMobileModule --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",

Global Operations

Resource path: `/global-config/authentication/modules/authSocialWeChatMobile`

Resource version: `1.0`

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action SocialAuthWeChatMobileModule --global --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action SocialAuthWeChatMobileModule --global --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action SocialAuthWeChatMobileModule --global --actionName nextdescendents
```

read

Usage:

```
am> read SocialAuthWeChatMobileModule --global
```

update

Usage:

```
am> update SocialAuthWeChatMobileModule --global --body body
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "defaults" : {
      "properties" : {
        "accountProvisioning" : {
```

SocialAuthWeChatModule

Realm Operations

Resource path: `/realm-config/authentication/modules/authSocialWeChat`

Resource version: `1.0`

create

Usage:

```
am> create SocialAuthWeChatModule --realm Realm --id id --body body
```

Parameters:

`--id`

The unique identifier for the resource.

`--body`

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "accountProvisioning" : {
      "type" : "object",

```

delete

Usage:

```
am> delete SocialAuthWeChatModule --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action SocialAuthWeChatModule --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action SocialAuthWeChatModule --realm Realm --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action SocialAuthWeChatModule --realm Realm --actionName nextdescendents
```

query

Get the full list of instances of this collection. This query only supports `_queryFilter=true` filter.

Usage:

```
am> query SocialAuthWeChatModule --realm Realm --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read SocialAuthWeChatModule --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update SocialAuthWeChatModule --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "accountProvisioning" : {

Global Operations

Resource path: `/global-config/authentication/modules/authSocialWeChat`

Resource version: `1.0`

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action SocialAuthWeChatModule --global --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action SocialAuthWeChatModule --global --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action SocialAuthWeChatModule --global --actionName nextdescendents
```

read

Usage:

```
am> read SocialAuthWeChatModule --global
```

update

Usage:

```
am> update SocialAuthWeChatModule --global --body body
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",

SocialAuthentication

Realm Operations

Resource path: `/realm-config/services/socialauthentication`

Resource version: `1.0`

create

Usage:

```
am> create SocialAuthentication --realm Realm --body body
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "displayNames" : {
      "title" : "Display Names",
      "description" : "The display names for the implementations - this will be used to provide a name
 for the icon displayed on the login page. The key should be used across all the settings on this page
 to join them together.<br><br>For example:<table><tr><th>Key</th><th>Value</th></tr><tr><td>google</
td><td>Google</td></tr></table>",
      "propertyOrder" : 100,
      "required" : false,
      "patternProperties" : {
        ".*" : {
          "type" : "string"
        }
      },
      "type" : "object",
      "exampleValue" : ""
    },
    "authenticationChains" : {
      "title" : "Authentication Chains",
      "description" : "The name of the authentication chains that are the entry points to being
 authenticated by each respective social authentication provider. The key should correspond to a
 key used to define a Display Name above.<br><br>For example:<table><tr><th>Key</th><th>Value</th></
tr><tr><td>google</td><td>socialAuthChainGoogle</td></tr></table>",
      "propertyOrder" : 200,
      "required" : false,
      "patternProperties" : {
        ".*" : { }
      },
      "type" : "object",
      "exampleValue" : ""
    },
```

```
    "enabledKeys" : {
      "title" : "Enabled Implementations",
      "description" : "Provide a key that has been used to define the settings above to enable that
 set of settings.<br><br>For example: google",
      "propertyOrder" : 400,
      "required" : true,
      "items" : {
        "type" : "string"
      },
      "type" : "array",
      "exampleValue" : ""
    },
    "icons" : {
      "title" : "Icons",
      "description" : "Either a full URL or a path relative to the base of the site/server where the
 image can be found. The image will be used on the login page to link to the authentication chain
 defined above. The key should correspond to a key used to define a Display Name above.<br><br>For
 example:<table><tr><th>Key</th><th>Value</th></tr><tr><td>google</td><td>/images/google-sign-in.png</

        ".*" : {
          "type" : "string"
        }
      },
      "type" : "object",
      "exampleValue" : ""
    }
  }
}
```

delete

Usage:

```
am> delete SocialAuthentication --realm Realm
```

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action SocialAuthentication --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action SocialAuthentication --realm Realm --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action SocialAuthentication --realm Realm --actionName nextdescendents
```

read

Usage:

```
am> read SocialAuthentication --realm Realm
```

update

Usage:

```
am> update SocialAuthentication --realm Realm --body body
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",

}
```

Global Operations

Resource path: `/global-config/services/socialauthentication`

Resource version: `1.0`

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action SocialAuthentication --global --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action SocialAuthentication --global --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action SocialAuthentication --global --actionName nextdescendents
```

read

Usage:

```
am> read SocialAuthentication --global
```

update

Usage:

```
am> update SocialAuthentication --global --body body
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```

}
```

delete

Usage:

```
am> delete SocialFacebook --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action SocialFacebook --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action SocialFacebook --realm Realm --actionName getCreatableTypes
```

listOutcomes

List the available outcomes for the node type.

Usage:

```
am> action SocialFacebook --realm Realm --body body --actionName listOutcomes
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "title" : "Some configuration of the node. This does not need to be complete against the
 configuration schema."
}
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action SocialFacebook --realm Realm --actionName nextdescendents
```

query

Get the full list of instances of this collection. This query only supports `_queryFilter=true` filter.

Usage:

```
am> query SocialFacebook --realm Realm --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read SocialFacebook --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update SocialFacebook --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "cfgAttributeMappingConfiguration" : {
      "title" : "Attribute Mapper Configuration",

```

delete

Usage:

```
am> delete SocialGoogle --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action SocialGoogle --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action SocialGoogle --realm Realm --actionName getCreatableTypes
```

listOutcomes

List the available outcomes for the node type.

Usage:

```
am> action SocialGoogle --realm Realm --body body --actionName listOutcomes
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "title" : "Some configuration of the node. This does not need to be complete against the
 configuration schema."
}
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action SocialGoogle --realm Realm --actionName nextdescendents
```

query

Get the full list of instances of this collection. This query only supports `_queryFilter=true` filter.

Usage:

```
am> query SocialGoogle --realm Realm --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read SocialGoogle --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update SocialGoogle --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```

```

SocialIdentityProviders

Realm Operations

Collection of configured social identity providers.

Resource path: `/selfservice/socialIdentityProviders`

Resource version: `1.0`

read

Reads the list of configured social identity providers.

Usage:

```
am> read SocialIdentityProviders --realm Realm
```

SocialIdentityProvidersConfig

Realm Operations

Resource path: `/realm-config/services/SocialIdentityProviders`

Resource version: `1.0`

create

Usage:

```
am> create SocialIdentityProvidersConfig --realm Realm --body body
```

Parameters:

`--body`

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "enabled" : {
      "title" : "Enabled",
      "description" : "",
      "propertyOrder" : 100,
      "required" : true,
      "type" : "boolean",
      "exampleValue" : ""
    }
  }
}
```

delete

Usage:

```
am> delete SocialIdentityProvidersConfig --realm Realm
```

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action SocialIdentityProvidersConfig --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action SocialIdentityProvidersConfig --realm Realm --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action SocialIdentityProvidersConfig --realm Realm --actionName nextdescendents
```

read

Usage:

```
am> read SocialIdentityProvidersConfig --realm Realm
```

update

Usage:

```
am> update SocialIdentityProvidersConfig --realm Realm --body body
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "enabled" : {
      "title" : "Enabled",
      "description" : "",
      "propertyOrder" : 100,
      "required" : true,
      "type" : "boolean",
      "exampleValue" : ""
    }
  }
}
```

Global Operations

Resource path: `/global-config/services/SocialIdentityProviders`

Resource version: `1.0`

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action SocialIdentityProvidersConfig --global --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action SocialIdentityProvidersConfig --global --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action SocialIdentityProvidersConfig --global --actionName nextdescendents
```

read

Usage:

```
am> read SocialIdentityProvidersConfig --global
```

update

Usage:

```
am> update SocialIdentityProvidersConfig --global --body body
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "defaults" : {
      "properties" : {
        "enabled" : {
          "title" : "Enabled",
          "description" : "",
          "propertyOrder" : 100,
          "required" : true,
          "type" : "boolean",
          "exampleValue" : ""
        }
      },
      "type" : "object",
      "title" : "Realm Defaults"
    }
  }
}
```

SocialIgnoreProfile

Realm Operations

Resource path: `/realm-config/authentication/authenticationtrees/nodes/SocialOAuthIgnoreProfileNode`

Resource version: `1.0`

create

Usage:

```
am> create SocialIgnoreProfile --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "required" : [ ]
}
```

delete

Usage:

```
am> delete SocialIgnoreProfile --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action SocialIgnoreProfile --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action SocialIgnoreProfile --realm Realm --actionName getCreatableTypes
```

listOutcomes

List the available outcomes for the node type.

Usage:

```
am> action SocialIgnoreProfile --realm Realm --body body --actionName listOutcomes
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "title" : "Some configuration of the node. This does not need to be complete against the
 configuration schema."
}
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action SocialIgnoreProfile --realm Realm --actionName nextdescendents
```

query

Get the full list of instances of this collection. This query only supports `_queryFilter=true` filter.

Usage:

```
am> query SocialIgnoreProfile --realm Realm --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read SocialIgnoreProfile --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update SocialIgnoreProfile --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "required" : [ ]
}
```

SocialProviderHandlerNode

Realm Operations

Resource path: `/realm-config/authentication/authenticationtrees/nodes/SocialProviderHandlerNode`

Resource version: `1.0`

create

Usage:

```
am> create SocialProviderHandlerNode --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "usernameAttribute" : {
      "title" : "Username Attribute",
      "description" : "The attribute in IDM that contains the username for this object.",
      "propertyOrder" : 300,
      "type" : "string",
      "exampleValue" : ""
    },
    "script" : {
      "title" : "Transformation Script",
      "description" : "A script that can transform a normalized social profile to object data.",
      "propertyOrder" : 100,
      "type" : "string",
      "exampleValue" : ""
    }
  },
  "required" : [ "usernameAttribute", "script" ]
}
```

delete

Usage:

```
am> delete SocialProviderHandlerNode --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action SocialProviderHandlerNode --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action SocialProviderHandlerNode --realm Realm --actionName getCreatableTypes
```

listOutcomes

List the available outcomes for the node type.

Usage:

```
am> action SocialProviderHandlerNode --realm Realm --body body --actionName listOutcomes
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "title" : "Some configuration of the node. This does not need to be complete against the
 configuration schema."
}
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action SocialProviderHandlerNode --realm Realm --actionName nextdescendents
```

query

Get the full list of instances of this collection. This query only supports `_queryFilter=true` filter.

Usage:

```
am> query SocialProviderHandlerNode --realm Realm --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read SocialProviderHandlerNode --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update SocialProviderHandlerNode --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "usernameAttribute" : {
      "title" : "Username Attribute",
      "description" : "The attribute in IDM that contains the username for this object.",
      "propertyOrder" : 300,
      "type" : "string",
      "exampleValue" : ""
    },
    "script" : {
      "title" : "Transformation Script",
      "description" : "A script that can transform a normalized social profile to object data.",
      "propertyOrder" : 100,
      "type" : "string",
      "exampleValue" : ""
    }
  },
  "required" : [ "usernameAttribute", "script" ]
}
```

SoftwarePublisher

Realm Operations

Agents handler that is responsible for managing agents

Resource path: `/realm-config/agents/SoftwarePublisher`

Resource version: `1.0`

create

Usage:

```
am> create SoftwarePublisher --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "jwksUri" : {
      "title" : "Json Web Key URI",
      "description" : "The URI that contains the Software Publisher's public keys in Json Web Key
 format.",
      "propertyOrder" : 34800,
      "type" : "object",

      "exampleValue" : ""
    }
  }
}
```

delete

Usage:

```
am> delete SoftwarePublisher --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action SoftwarePublisher --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action SoftwarePublisher --realm Realm --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action SoftwarePublisher --realm Realm --actionName nextdescendents
```

query

Querying the agents of a specific type

Usage:

```
am> query SoftwarePublisher --realm Realm --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read SoftwarePublisher --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update SoftwarePublisher --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "jwksUri" : {
      "title" : "Json Web Key URI",

Splunk

Realm Operations

Resource path: `/realm-config/services/audit/Splunk`

Resource version: `1.0`

create

Usage:

```
am> create Splunk --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "commonHandler" : {
      "type" : "object",
      "title" : "General Handler Configuration",
      "propertyOrder" : 0,
      "properties" : {
        "topics" : {
          "title" : "Topics",
          "description" : "List of topics handled by an audit event handler.",
          "propertyOrder" : 200,
          "required" : true,
          "items" : {
            "type" : "string"
          },
          "type" : "array",
          "exampleValue" : ""
        },
        "enabled" : {
          "title" : "Enabled",
          "description" : "Enables or disables an audit event handler.",
          "propertyOrder" : 100,
          "required" : true,
          "type" : "boolean",
          "exampleValue" : ""
        }
      }
    },
```

```

        }
      }
    }
  }
}
```

delete

Usage:

```
am> delete Splunk --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action Splunk --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action Splunk --realm Realm --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action Splunk --realm Realm --actionName nextdescendents
```

query

Get the full list of instances of this collection. This query only supports `_queryFilter=true` filter.

Usage:

```
am> query Splunk --realm Realm --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read Splunk --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update Splunk --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "commonHandler" : {
      "type" : "object",

        }
      }
    }
  }
}
```

delete

Usage:

```
am> delete Splunk --global --id id
```

Parameters:

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action Splunk --global --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action Splunk --global --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action Splunk --global --actionName nextdescendents
```

query

Get the full list of instances of this collection. This query only supports `_queryFilter=true` filter.

Usage:

```
am> query Splunk --global --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read Splunk --global --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update Splunk --global --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",

```

StateMetadata

Realm Operations

Resource path: `/realm-config/authentication/authenticationtrees/nodes/MetadataNode`

Resource version: `1.0`

create

Usage:

```
am> create StateMetadata --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "attributes" : {
      "title" : "Attributes",
      "description" : "List of attributes that will be selected from the shared state (if they exist)
 and will be returned to the user-agent in a metadata callback.",
      "propertyOrder" : 100,
      "items" : {
        "type" : "string"
      },
      "type" : "array",
      "exampleValue" : ""
    }
  },
  "required" : [ "attributes" ]
}
```

delete

Usage:

```
am> delete StateMetadata --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action StateMetadata --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action StateMetadata --realm Realm --actionName getCreatableTypes
```

listOutcomes

List the available outcomes for the node type.

Usage:

```
am> action StateMetadata --realm Realm --body body --actionName listOutcomes
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "title" : "Some configuration of the node. This does not need to be complete against the
 configuration schema."
}
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action StateMetadata --realm Realm --actionName nextdescendents
```

query

Get the full list of instances of this collection. This query only supports `_queryFilter=true` filter.

Usage:

```
am> query StateMetadata --realm Realm --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read StateMetadata --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update StateMetadata --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "attributes" : {
      "title" : "Attributes",
      "description" : "List of attributes that will be selected from the shared state (if they exist)
 and will be returned to the user-agent in a metadata callback.",
      "propertyOrder" : 100,
      "items" : {
        "type" : "string"
      },
      "type" : "array",
      "exampleValue" : ""
    }
  },
  "required" : [ "attributes" ]
}
```

SubjectAttributes

Realm Operations

Service for querying subject attributes stored in OpenAM. When you define a policy subject condition, the condition can depend on values of subject attributes stored in a user's profile. The list of possible subject attributes that you can use depends on the LDAP User Attributes configured for the Identity data store where OpenAM looks up the user's profile

Resource path: `/subjectattributes`

Resource version: `1.0`

query

Query the list of subject attributes stored in OpenAM

Usage:

```
am> query SubjectAttributes --realm Realm --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all. Fields that can be queried: [*]

SubjectTypes

Realm Operations

Service for querying and reading the subject types stored in OpenAM. Subject condition types describe the JSON representation of subject conditions that you can use in policy definitions

Resource path: `/subjecttypes`

Resource version: `1.0`

query

Query the list of subject condition types

Usage:

```
am> query SubjectTypes --realm Realm --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all. Fields that can be queried: [*]

read

Read an individual subject condition type by providing the unique identifier title

Usage:

```
am> read SubjectTypes --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

SuccessURL

Realm Operations

Resource path: `/realm-config/authentication/authenticationtrees/nodes/SetSuccessUrlNode`

Resource version: `1.0`

create

Usage:

```
am> create SuccessURL --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "successUrl" : {
      "title" : "Success URL",
      "description" : "",
      "propertyOrder" : 100,
      "type" : "string",
      "exampleValue" : ""
    }
  },
  "required" : [ "successUrl" ]
}
```

delete

Usage:

```
am> delete SuccessURL --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action SuccessURL --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action SuccessURL --realm Realm --actionName getCreatableTypes
```

listOutcomes

List the available outcomes for the node type.

Usage:

```
am> action SuccessURL --realm Realm --body body --actionName listOutcomes
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "title" : "Some configuration of the node. This does not need to be complete against the
 configuration schema."
}
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action SuccessURL --realm Realm --actionName nextdescendents
```

query

Get the full list of instances of this collection. This query only supports `_queryFilter=true` filter.

Usage:

```
am> query SuccessURL --realm Realm --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read SuccessURL --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update SuccessURL --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "successUrl" : {
      "title" : "Success URL",
      "description" : "",
      "propertyOrder" : 100,
      "type" : "string",
      "exampleValue" : ""
    }
  },
  "required" : [ "successUrl" ]
}
```

SunDSWithOpenAMSchema

Realm Operations

Resource path: `/realm-config/services/id-repositories/LDAPv3ForAMDS`

Resource version: `1.0`

create

Usage:

```
am> create SunDSWithOpenAMSchema --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```

}
```

delete

Usage:

```
am> delete SunDSWithOpenAMSchema --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action SunDSWithOpenAMSchema --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action SunDSWithOpenAMSchema --realm Realm --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action SunDSWithOpenAMSchema --realm Realm --actionName nextdescendents
```

query

Get the full list of instances of this collection. This query only supports `_queryFilter=true` filter.

Usage:

```
am> query SunDSWithOpenAMSchema --realm Realm --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read SunDSWithOpenAMSchema --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update SunDSWithOpenAMSchema --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "roleconfig" : {
      "type" : "object",

        }
      }
    }
  }
}
```

SupportedIds

Global Operations

Resource path: `/global-config/services/id-repositories/SupportedIdentities`

Resource version: `1.0`

create

Usage:

```
am> create SupportedIds --global --id id --body body
```

Parameters:

`--id`

The unique identifier for the resource.

`--body`

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object"
}
```

delete

Usage:

```
am> delete SupportedIds --global --id id
```

Parameters:

`--id`

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action SupportedIds --global --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action SupportedIds --global --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action SupportedIds --global --actionName nextdescendents
```

query

Get the full list of instances of this collection. This query only supports `_queryFilter=true` filter.

Usage:

```
am> query SupportedIds --global --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read SupportedIds --global --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update SupportedIds --global --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object"
}
```

Syslog

Realm Operations

Resource path: `/realm-config/services/audit/Syslog`

Resource version: `1.0`

create

Usage:

```
am> create Syslog --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "sysLogConfig" : {
      "type" : "object",

        }
      }
    }
  }
}
```

delete

Usage:

```
am> delete Syslog --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action Syslog --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action Syslog --realm Realm --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action Syslog --realm Realm --actionName nextdescendents
```

query

Get the full list of instances of this collection. This query only supports `_queryFilter=true` filter.

Usage:

```
am> query Syslog --realm Realm --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read Syslog --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update Syslog --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "sysLogConfig" : {
      "type" : "object",

    }
  }
}
```

delete

Usage:

```
am> delete Syslog --global --id id
```

Parameters:

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action Syslog --global --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action Syslog --global --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action Syslog --global --actionName nextdescendents
```

query

Get the full list of instances of this collection. This query only supports `_queryFilter=true` filter.

Usage:

```
am> query Syslog --global --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read Syslog --global --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update Syslog --global --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "sysLogBuffering" : {

TermsAndConditionsDecision

Realm Operations

Resource path: `/realm-config/authentication/authenticationtrees/nodes/TermsAndConditionsDecisionNode`

Resource version: `1.0`

create

Usage:

```
am> create TermsAndConditionsDecision --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "identityAttribute" : {
      "title" : "Identity Attribute",
      "description" : "The attribute to query for the IDM object.",
      "propertyOrder" : 100,
      "type" : "string",
      "exampleValue" : ""
    }
  },
  "required" : [ "identityAttribute" ]
}
```

delete

Usage:

```
am> delete TermsAndConditionsDecision --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action TermsAndConditionsDecision --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action TermsAndConditionsDecision --realm Realm --actionName getCreatableTypes
```

listOutcomes

List the available outcomes for the node type.

Usage:

```
am> action TermsAndConditionsDecision --realm Realm --body body --actionName listOutcomes
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "title" : "Some configuration of the node. This does not need to be complete against the
 configuration schema."
}
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action TermsAndConditionsDecision --realm Realm --actionName nextdescendents
```

query

Get the full list of instances of this collection. This query only supports `_queryFilter=true` filter.

Usage:

```
am> query TermsAndConditionsDecision --realm Realm --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read TermsAndConditionsDecision --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update TermsAndConditionsDecision --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "identityAttribute" : {
      "title" : "Identity Attribute",
      "description" : "The attribute to query for the IDM object.",
      "propertyOrder" : 100,
      "type" : "string",
      "exampleValue" : ""
    }
  },
  "required" : [ "identityAttribute" ]
}
```

TimeSinceDecision

Realm Operations

Resource path: `/realm-config/authentication/authenticationtrees/nodes/TimeSinceDecisionNode`

Resource version: `1.0`

create

Usage:

```
am> create TimeSinceDecision --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "elapsedTime" : {
      "title" : "Elapsed Time",
      "description" : "The amount of elapsed time, in minutes, to compare.",
      "propertyOrder" : 100,
      "type" : "string",
      "exampleValue" : ""
    },
    "identityAttribute" : {
      "title" : "Identity Attribute",
      "description" : "The attribute to query in the IDM object.",
      "propertyOrder" : 300,
      "type" : "string",
      "exampleValue" : ""
    }
  },
  "required" : [ "elapsedTime", "identityAttribute" ]
}
```

delete

Usage:

```
am> delete TimeSinceDecision --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action TimeSinceDecision --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action TimeSinceDecision --realm Realm --actionName getCreatableTypes
```

listOutcomes

List the available outcomes for the node type.

Usage:

```
am> action TimeSinceDecision --realm Realm --body body --actionName listOutcomes
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "title" : "Some configuration of the node. This does not need to be complete against the
 configuration schema."
}
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action TimeSinceDecision --realm Realm --actionName nextdescendents
```

query

Get the full list of instances of this collection. This query only supports `_queryFilter=true` filter.

Usage:

```
am> query TimeSinceDecision --realm Realm --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read TimeSinceDecision --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update TimeSinceDecision --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "elapsedTime" : {
      "title" : "Elapsed Time",
      "description" : "The amount of elapsed time, in minutes, to compare.",
      "propertyOrder" : 100,
      "type" : "string",
      "exampleValue" : ""
    },
    "identityAttribute" : {
      "title" : "Identity Attribute",
      "description" : "The attribute to query in the IDM object.",
      "propertyOrder" : 300,
      "type" : "string",
      "exampleValue" : ""
    }
  },
  "required" : [ "elapsedTime", "identityAttribute" ]
}
```

TimerStart

Realm Operations

Resource path: `/realm-config/authentication/authenticationtrees/nodes/TimerStartNode`

Resource version: `1.0`

create

Usage:

```
am> create TimerStart --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "startTimeProperty" : {
      "title" : "Start Time Property",
      "description" : "Identifier of property into which start time should be stored by this node.",
      "propertyOrder" : 100,
      "type" : "string",
      "exampleValue" : ""
    }
  },
  "required" : [ "startTimeProperty" ]
}
```

delete

Usage:

```
am> delete TimerStart --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action TimerStart --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action TimerStart --realm Realm --actionName getCreatableTypes
```

listOutcomes

List the available outcomes for the node type.

Usage:

```
am> action TimerStart --realm Realm --body body --actionName listOutcomes
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "title" : "Some configuration of the node. This does not need to be complete against the
 configuration schema."
}
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action TimerStart --realm Realm --actionName nextdescendents
```

query

Get the full list of instances of this collection. This query only supports `_queryFilter=true` filter.

Usage:

```
am> query TimerStart --realm Realm --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read TimerStart --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update TimerStart --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "startTimeProperty" : {
      "title" : "Start Time Property",
      "description" : "Identifier of property into which start time should be stored by this node.",
      "propertyOrder" : 100,
      "type" : "string",
      "exampleValue" : ""
    }
  },
  "required" : [ "startTimeProperty" ]
}
```

TimerStop

Realm Operations

Resource path: `/realm-config/authentication/authenticationtrees/nodes/TimerStopNode`

Resource version: `1.0`

create

Usage:

```
am> create TimerStop --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "startTimeProperty" : {
      "title" : "Start Time Property",
      "description" : "Identifier of property in which start time should have been stored by a \"Timer
 Start\" node.",
      "propertyOrder" : 100,
      "type" : "string",
      "exampleValue" : ""
    },
    "metricKey" : {
      "title" : "Metric Key",
      "description" : "Identifier of metric to update when this node is processed.",
      "propertyOrder" : 200,
      "type" : "string",
      "exampleValue" : ""
    }
  },
  "required" : [ "metricKey", "startTimeProperty" ]
}
```

delete

Usage:

```
am> delete TimerStop --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action TimerStop --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action TimerStop --realm Realm --actionName getCreatableTypes
```

listOutcomes

List the available outcomes for the node type.

Usage:

```
am> action TimerStop --realm Realm --body body --actionName listOutcomes
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "title" : "Some configuration of the node. This does not need to be complete against the
 configuration schema."
}
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action TimerStop --realm Realm --actionName nextdescendents
```

query

Get the full list of instances of this collection. This query only supports `_queryFilter=true` filter.

Usage:

```
am> query TimerStop --realm Realm --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read TimerStop --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update TimerStop --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "startTimeProperty" : {
      "title" : "Start Time Property",
      "description" : "Identifier of property in which start time should have been stored by a \"Timer
 Start\" node.",
      "propertyOrder" : 100,
      "type" : "string",
      "exampleValue" : ""
    },
    "metricKey" : {
      "title" : "Metric Key",
      "description" : "Identifier of metric to update when this node is processed.",
      "propertyOrder" : 200,
      "type" : "string",
      "exampleValue" : ""
    }
  },
  "required" : [ "metricKey", "startTimeProperty" ]
}
```

TivoliDirectoryServer

Realm Operations

Resource path: `/realm-config/services/id-repositories/LDAPv3ForTivoli`

Resource version: `1.0`

create

Usage:

```
am> create TivoliDirectoryServer --realm Realm --id id --body body

}
```

delete

Usage:

```
am> delete TivoliDirectoryServer --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action TivoliDirectoryServer --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action TivoliDirectoryServer --realm Realm --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action TivoliDirectoryServer --realm Realm --actionName nextdescendents
```

query

Get the full list of instances of this collection. This query only supports `_queryFilter=true` filter.

Usage:

```
am> query TivoliDirectoryServer --realm Realm --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read TivoliDirectoryServer --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update TivoliDirectoryServer --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```

```

TransactionAuthentication

Realm Operations

Resource path: `/realm-config/services/transaction`

Resource version: `1.0`

create

Usage:

```
am> create TransactionAuthentication --realm Realm --body body
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "timeToLive" : {
      "title" : "Time to Live",
      "description" : "The number of seconds within which the transaction must be completed.",
      "propertyOrder" : 0,
      "required" : true,
      "type" : "string",
      "exampleValue" : ""
    }
  }
}
```

delete

Usage:

```
am> delete TransactionAuthentication --realm Realm
```

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action TransactionAuthentication --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action TransactionAuthentication --realm Realm --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action TransactionAuthentication --realm Realm --actionName nextdescendents
```

read

Usage:

```
am> read TransactionAuthentication --realm Realm
```

update

Usage:

```
am> update TransactionAuthentication --realm Realm --body body
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "timeToLive" : {
      "title" : "Time to Live",
      "description" : "The number of seconds within which the transaction must be completed.",
      "propertyOrder" : 0,
      "required" : true,
      "type" : "string",
      "exampleValue" : ""
    }
  }
}
```

Global Operations

Resource path: `/global-config/services/transaction`

Resource version: `1.0`

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action TransactionAuthentication --global --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action TransactionAuthentication --global --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action TransactionAuthentication --global --actionName nextdescendents
```

read

Usage:

```
am> read TransactionAuthentication --global
```

update

Usage:

```
am> update TransactionAuthentication --global --body body
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "defaults" : {
      "properties" : {
        "timeToLive" : {
          "title" : "Time to Live",
          "description" : "The number of seconds within which the transaction must be completed.",
          "propertyOrder" : 0,
          "required" : true,
          "type" : "string",
          "exampleValue" : ""
        }
      },
      "type" : "object",
      "title" : "Realm Defaults"
    }
  }
}
```

TrustedJwtIssuer

Realm Operations

Agents handler that is responsible for managing agents

Resource path: `/realm-config/agents/TrustedJwtIssuer`

Resource version: `1.0`

create

Usage:

```
am> create TrustedJwtIssuer --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "agentgroup" : {
      "title" : "Group",

    }
  }
}
```

delete

Usage:

```
am> delete TrustedJwtIssuer --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action TrustedJwtIssuer --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action TrustedJwtIssuer --realm Realm --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action TrustedJwtIssuer --realm Realm --actionName nextdescendents
```

query

Querying the agents of a specific type

Usage:

```
am> query TrustedJwtIssuer --realm Realm --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read TrustedJwtIssuer --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update TrustedJwtIssuer --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "agentgroup" : {
      "title" : "Group",
      "description" : "Add the agent to a group to allow inheritance of property values from the
 group. <br>Changing the group will update inherited property values. <br>Inherited property values
 are copied to the agent.",
      "propertyOrder" : 5,
      "required" : false,
      "type" : "string",
      "exampleValue" : ""
    },
    "jwksUri" : {
      "title" : "JWKs URI",
      "description" : "URI to retrieve JWK verification keys from to validate the JWT signature.",
      "propertyOrder" : 20,
```

```

}
```

TrustedUserDevices

Realm Operations

Trusted devices service is responsible for querying and deleting trusted devices.

Resource path: `/users/{user}/devices/trusted`

Resource version: `1.0`

delete

Delete trusted user device

Usage:

```
am> delete TrustedUserDevices --realm Realm --id id --user user
```

Parameters:

--id

The unique identifier for the resource.

--user

Trusted devices service is responsible for querying and deleting trusted devices.

query

Query trusted user devices

Usage:

```
am> query TrustedUserDevices --realm Realm --filter filter --user user
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all. Fields that can be queried: [*]

--user

Trusted devices service is responsible for querying and deleting trusted devices.

TwitterClient

Realm Operations

Resource path: `/realm-config/services/SocialIdentityProviders/twitterConfig`

Resource version: `1.0`

create

Usage:

```
am> create TwitterClient --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
```

```
    "redirectURI" : {
      "title" : "Redirect URL",
      "description" : "",
      "propertyOrder" : 700,
      "required" : true,
      "type" : "string",
      "exampleValue" : ""
    },
    "authenticationIdKey" : {
      "title" : "Auth ID Key",
      "description" : "Field used to identify a user by the social provider.",

      "required" : true,
      "type" : "string",
      "exampleValue" : ""
    }
  }
}
```

delete

Usage:

```
am> delete TwitterClient --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action TwitterClient --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action TwitterClient --realm Realm --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action TwitterClient --realm Realm --actionName nextdescendents
```

query

Get the full list of instances of this collection. This query only supports `_queryFilter=true` filter.

Usage:

```
am> query TwitterClient --realm Realm --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read TwitterClient --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update TwitterClient --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "redirectURI" : {
      "title" : "Redirect URL",

}
```

UmaDataStoreProperties

Global Operations

An object of property key-value pairs

Resource path: `/global-config/servers/{serverName}/properties/uma`

Resource version: `1.0`

read

Usage:

```
am> read UmaDataStoreProperties --global --serverName serverName
```

Parameters:

`--serverName`

An object of property key-value pairs

update

Usage:

```
am> update UmaDataStoreProperties --global --serverName serverName --body body
```

Parameters:

`--serverName`

An object of property key-value pairs

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",

}
```

UmaPolicies

Realm Operations

Provides create, delete and query operations for UMA Policies

Resource path: `/users/{user}/uma/policies`

Resource version: `1.0`

create

Creates an UMA Policy

Usage:

```
am> create UmaPolicies --realm Realm --id id --body body --user user
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "$schema" : "http://json-schema.org/draft-04/schema#",
  "description" : "A policy defining who can access a particular resource set",
  "type" : "object",
  "title" : "UMA Policy",
  "properties" : {
    "policyId" : {
      "type" : "string",
      "title" : "Policy ID",
      "description" : "The ID must correspond with an existing resource set ID"
    },
    "permissions" : {
      "type" : "array",
      "title" : "Permissions",
      "description" : "A list of subjects and the scopes they are allowed access to",
      "items" : {
        "type" : "object",
        "properties" : {
          "subject" : {
            "type" : "string",
            "title" : "Subject",
            "description" : "The username of the subject"
          },
          "scopes" : {
            "type" : "array",
            "title" : "Scopes",
            "description" : "The scopes that the user is allowed access to",
            "items" : {
              "type" : "string"
            }
          }
        }
      }
    }
  }
}
```

--user

Provides create, delete and query operations for UMA Policies

delete

Deletes an UMA Policy

Usage:

```
am> delete UmaPolicies --realm Realm --id id --user user
```

Parameters:

--id

The unique identifier for the resource.

--user

Provides create, delete and query operations for UMA Policies

query

Queries an UMA Policy

Usage:

```
am> query UmaPolicies --realm Realm --filter filter --user user
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all. Fields that can be queried: [*]

--user

Provides create, delete and query operations for UMA Policies

read

Reads an UMA Policy

Usage:

```
am> read UmaPolicies --realm Realm --id id --user user
```

Parameters:

--id

The unique identifier for the resource.

--user

Provides create, delete and query operations for UMA Policies

update

Updates an UMA Policy

Usage:

```
am> update UmaPolicies --realm Realm --id id --body body --user user
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "$schema" : "http://json-schema.org/draft-04/schema#",
  "description" : "A policy defining who can access a particular resource set",
  "type" : "object",
  "title" : "UMA Policy",
  "properties" : {
    "policyId" : {
      "type" : "string",
      "title" : "Policy ID",
      "description" : "The ID must correspond with an existing resource set ID"
    },
    "permissions" : {
      "type" : "array",
      "title" : "Permissions",
      "description" : "A list of subjects and the scopes they are allowed access to",
      "items" : {
        "type" : "object",
        "properties" : {
          "subject" : {
            "type" : "string",
            "title" : "Subject",
            "description" : "The username of the subject"
          },
          "scopes" : {
            "type" : "array",
            "title" : "Scopes",
            "description" : "The scopes that the user is allowed access to",
            "items" : {
              "type" : "string"
            }
          }
        }
      }
    }
  }
}
```

--user

Provides create, delete and query operations for UMA Policies

UmaProvider

Realm Operations

Resource path: `/realm-config/services/uma`

Resource version: `1.0`

create

Usage:

```
am> create UmaProvider --realm Realm --body body
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "resharingMode" : {
      "title" : "Re-Sharing Mode",

      "description" : "Specifies whether to use the Pending Requests subsystem that notifies the
 resource owner that an attempt to access a resource was made.",
      "propertyOrder" : 450,
      "required" : true,
      "type" : "boolean",
      "exampleValue" : ""
    }
  }
}
```

delete

Usage:

```
am> delete UmaProvider --realm Realm
```

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action UmaProvider --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action UmaProvider --realm Realm --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action UmaProvider --realm Realm --actionName nextdescendents
```

read

Usage:

```
am> read UmaProvider --realm Realm
```

update

Usage:

```
am> update UmaProvider --realm Realm --body body
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "resharingMode" : {
      "title" : "Re-Sharing Mode",

      "description" : "Specifies whether to use the Pending Requests subsystem that notifies the
 resource owner that an attempt to access a resource was made.",
      "propertyOrder" : 450,
      "required" : true,
      "type" : "boolean",
      "exampleValue" : ""
    }
  }
}
```

Global Operations

Resource path: `/global-config/services/uma`

Resource version: `1.0`

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action UmaProvider --global --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action UmaProvider --global --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action UmaProvider --global --actionName nextdescendents
```

read

Usage:

```
am> read UmaProvider --global
```

update

Usage:

```
am> update UmaProvider --global --body body
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "defaults" : {
      "properties" : {
        "deletePoliciesOnDeleteRS" : {
          "title" : "Delete user policies when Resource Server is removed",
          "description" : "Delete all user policies that relate to a Resource Server when removing the
 OAuth2 agent entry or removing the <code>uma_protection</code> scope from the OAuth2 agent.",
          "propertyOrder" : 300,
          "required" : true,

}
```

UmaResourceSetLabels

Realm Operations

Provides create, delete and query operations for UMA resource set labels

Resource path: `/users/{user}/oauth2/resources/labels`

Resource version: `1.0`

create

Creates a UMA Resource Set Label

Usage:

```
am> create UmaResourceSetLabels --realm Realm --id id --body body --user user
```

Parameters:

`--id`

The unique identifier for the resource.

`--body`

The resource in JSON format, described by the following JSON schema:

```
{
  "description" : "Represents a UMA Resource Set Label",
  "id" : "urn:jsonschema:org:forgerock:openam:oauth2:resources:labels:ResourceSetLabel",
  "type" : "object",
  "title" : "UMA Resource Set Label",
  "properties" : {
    "id" : {
      "type" : "string",
      "description" : "The unique identifier of the resource set label",
      "title" : "Id"
    },
    "name" : {
      "type" : "string",
      "description" : "The displayed text of the label",
      "title" : "Name"
    },
    "type" : {
      "type" : "string",
      "description" : "The type of the label e.g. 'System'",
      "title" : "Type",
      "enum" : [ "STAR", "USER", "SYSTEM" ]
    },
    "resourceSetIds" : {
      "type" : "array",
      "items" : {
        "type" : "string"
      }
    }
  }
}
```

--user

Provides create, delete and query operations for UMA resource set labels

delete

Deletes a UMA Resource Set Label

Usage:

```
am> delete UmaResourceSetLabels --realm Realm --id id --user user
```

Parameters:

--id

The unique identifier for the resource.

--user

Provides create, delete and query operations for UMA resource set labels

query

Queries the collection of UMA labels

Usage:

```
am> query UmaResourceSetLabels --realm Realm --filter filter --user user
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all. Fields that can be queried: [*]

--user

Provides create, delete and query operations for UMA resource set labels

UmaUserAuditHistory

Realm Operations

Provides access to UMA auditing history for a user

Resource path: `/users/{user}/uma/auditHistory`

Resource version: `1.0`

getHistory

Returns the audit history of a user

Usage:

```
am> action UmaUserAuditHistory --realm Realm --user user --actionName getHistory
```

Parameters:

--user

Provides access to UMA auditing history for a user

query

Queries the collection of auditing history

Usage:

```
am> query UmaUserAuditHistory --realm Realm --filter filter --user user
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all. Fields that can be queried: [*]

--user

Provides access to UMA auditing history for a user

User

Realm Operations

Resource path: `/realm-config/services/user`

Resource version: `1.0`

create

Usage:

```
am> create User --realm Realm --body body
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "dynamic" : {
      "properties" : {
        "adminDNStartingView" : {
          "title" : "Administrator DN Starting View",
          "description" : "Specifies the DN for the initial screen when the OpenAM administrator
 successfully logs in to the OpenAM console.",
          "propertyOrder" : 200,
          "required" : false,
          "type" : "string",
          "exampleValue" : ""
        },
        "defaultUserStatus" : {
          "title" : "Default User Status",
          "description" : "Inactive users cannot authenticate, though OpenAM stores their profiles.",
          "propertyOrder" : 300,
          "required" : true,
          "type" : "string",
```

```
          "exampleValue" : ""
        },
        "preferredTimezone" : {
          "title" : "User Preferred Timezone",
          "description" : "Time zone for accessing OpenAM console.",
          "propertyOrder" : 100,
          "required" : true,
          "type" : "string",
          "exampleValue" : ""
        }
      },
      "type" : "object",
      "title" : "Dynamic Attributes"
    }
  }
}
```

delete

Usage:

```
am> delete User --realm Realm
```

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action User --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action User --realm Realm --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action User --realm Realm --actionName nextdescendents
```

read

Usage:

```
am> read User --realm Realm
```

update

Usage:

```
am> update User --realm Realm --body body
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "dynamic" : {
      "properties" : {
        "adminDNStartingView" : {
          "title" : "Administrator DN Starting View",
          "description" : "Specifies the DN for the initial screen when the OpenAM administrator
 successfully logs in to the OpenAM console.",
          "propertyOrder" : 200,
          "required" : false,
          "type" : "string",
          "exampleValue" : ""
        },
        "defaultUserStatus" : {
          "title" : "Default User Status",
          "description" : "Inactive users cannot authenticate, though OpenAM stores their profiles.",
          "propertyOrder" : 300,
          "required" : true,
          "type" : "string",
          "exampleValue" : ""
        },
        "preferredTimezone" : {
          "title" : "User Preferred Timezone",
          "description" : "Time zone for accessing OpenAM console.",
          "propertyOrder" : 100,
          "required" : true,
          "type" : "string",
          "exampleValue" : ""
        }
      },
      "type" : "object",
      "title" : "Dynamic Attributes"
    }
  }
}
```

Global Operations

Resource path: `/global-config/services/user`

Resource version: `1.0`

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action User --global --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action User --global --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action User --global --actionName nextdescendents
```

read

Usage:

```
am> read User --global
```

update

Usage:

```
am> update User --global --body body
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
```

```
    "dynamic" : {
      "properties" : {
        "adminDNStartingView" : {
          "title" : "Administrator DN Starting View",
          "description" : "Specifies the DN for the initial screen when the OpenAM administrator
 successfully logs in to the OpenAM console.",
          "propertyOrder" : 200,
          "required" : false,
          "type" : "string",
          "exampleValue" : ""
        },
        "defaultUserStatus" : {
          "title" : "Default User Status",
          "description" : "Inactive users cannot authenticate, though OpenAM stores their profiles.",
          "propertyOrder" : 300,
          "required" : true,
          "type" : "string",
          "exampleValue" : ""
        },
        "preferredTimezone" : {
          "title" : "User Preferred Timezone",
          "description" : "Time zone for accessing OpenAM console.",
          "propertyOrder" : 100,
          "required" : true,
          "type" : "string",
          "exampleValue" : ""
        }
      },
      "type" : "object",
      "title" : "Dynamic Attributes"
    }
  }
}
```

UserGroups

Realm Operations

The User Groups resource allows an admin to query which groups a particular user belongs to. The only supported method is query

Resource path: `/users/{user}/groups`

Resource version: `1.0`

query

Query the user's groups

Usage:

```
am> query UserGroups --realm Realm --filter filter --user user
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all. Fields that can be queried: [*]

--user

The User Groups resource allows an admin to query which groups a particular user belongs to. The only supported method is query

updateMemberships

Usage:

```
am> action UserGroups --realm Realm --body body --user user --actionName updateMemberships
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "$schema" : "http://json-schema.org/draft-04/schema#",
  "description" : "",
  "title" : "User groups schema",
  "type" : "object",
  "properties" : {
    "groups" : {
      "type" : "array",
      "title" : "Name",
      "description" : "The name of the group",
      "items" : {
        "type" : "string"
      }
    }
  }
}
```

--user

The User Groups resource allows an admin to query which groups a particular user belongs to. The only supported method is query

UserPolicies

Realm Operations

The User Policy resource endpoint is responsible for managing a user's policies. The available operations are create, read, update, delete, query. Policies are realm specific, hence the URI for the

policies API can contain a realm component. If the realm is not specified in the URI, the top level realm is used.

Resource path: `/users/{user}/policies`

Resource version: `1.0`

create

Create new policy

Usage:

```
am> create UserPolicies --realm Realm --id id --body body --user user
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "$schema" : "http://json-schema.org/draft-04/schema#",
  "description" : "Json schema for the policy resource",
  "title" : "Policy Resource Schema",
  "type" : "object",
  "properties" : {
    "name" : {
      "title" : "Name",
      "description" : "String matching the name of the application",
      "type" : "string"
    },
    "active" : {
      "title" : "Active flag",
      "description" : "Boolean indicating whether OpenAM considers the policy active for evaluation
 purposes, defaults to false",
      "type" : "boolean"
    },
    "description" : {
      "title" : "Description",
      "description" : "String describing the policy",
      "type" : "string"
    },
    "applicationName" : {
      "title" : "Application name",
      "description" : "String containing the application name, such as \"iPlanetAMWebAgentService\",
 or \"mypolicyset\"",
      "type" : "string"
    },
    "actionValues" : {
      "title" : "Action values",
```

```
     "description" : "Set of string action names, each set to a boolean indicating whether the action
is allowed. Chosen from the available actions provided by the associated Managing Resource Types
resource type",
     "type" : "object",
     "additionalProperties" : {
       "type" : "boolean"
     }
   },
   "resources" : {
     "title" : "Resources",
     "description" : "List of the resource name pattern strings to which the policy applies. Must
conform to the pattern templates provided by the associated Managing Resource Types resource type",
     "type" : "array",
     "items" : {
       "type" : "string"
     }
   },
   "subject" : {
     "title" : "Subject",
     "description" : "Specifies the subject conditions to which the policy applies, where subjects
can be combined by using the built-in types \"AND\", \"OR\", and \"NOT\", and where subject
implementations are pluggable",
     "type" : "object"
   },
   "condition" : {
     "title" : "Condition",

    },
    "lastModifiedDate" : {
      "title" : "Last Modified date",
      "description" : "An integer containing the last modified date and time, in number of seconds",
      "type" : "string"
    },
    "createdBy" : {
      "title" : "Created By",
      "description" : "A string containing the universal identifier DN of the subject that created the
 policy",
      "type" : "string"
    },
    "creationDate" : {
      "title" : "Creation Date",
      "description" : "An integer containing the creation date and time, in number of seconds",
      "type" : "string"
    }
  }
}
```

--user

The User Policy resource endpoint is responsible for managing a user's policies. The available operations are create, read, update, delete, query. Policies are realm specific, hence the URI for the policies API can contain a realm component. If the realm is not specified in the URI, the top level realm is used.

delete

Delete policy

Usage:

```
am> delete UserPolicies --realm Realm --id id --user user
```

Parameters:

--id

The unique identifier for the resource.

--user

The User Policy resource endpoint is responsible for managing a user's policies. The available operations are create, read, update, delete, query. Policies are realm specific, hence the URI for the policies API can contain a realm component. If the realm is not specified in the URI, the top level realm is used.

query

Query the stored policies

Usage:

```
am> query UserPolicies --realm Realm --filter filter --user user
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all. Fields that can be queried: [*]

--user

The User Policy resource endpoint is responsible for managing a user's policies. The available operations are create, read, update, delete, query. Policies are realm specific, hence the URI for the policies API can contain a realm component. If the realm is not specified in the URI, the top level realm is used.

read

Read policy

Usage:

```
am> read UserPolicies --realm Realm --id id --user user
```

Parameters:

--id

The unique identifier for the resource.

--user

The User Policy resource endpoint is responsible for managing a user's policies. The available operations are create, read, update, delete, query. Policies are realm specific, hence the URI for the policies API can contain a realm component. If the realm is not specified in the URI, the top level realm is used.

update

Update an existing policy

Usage:

```
am> update UserPolicies --realm Realm --id id --body body --user user
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "$schema" : "http://json-schema.org/draft-04/schema#",
  "description" : "Json schema for the policy resource",
  "title" : "Policy Resource Schema",
  "type" : "object",
  "properties" : {
    "name" : {
      "title" : "Name",
      "description" : "String matching the name of the application",
      "type" : "string"
    },
    "active" : {
      "title" : "Active flag",
      "description" : "Boolean indicating whether OpenAM considers the policy active for evaluation
 purposes, defaults to false",
      "type" : "boolean"
    },
    "description" : {
      "title" : "Description",
      "description" : "String describing the policy",
      "type" : "string"
    },
    "applicationName" : {
      "title" : "Application name",
      "description" : "String containing the application name, such as \"iPlanetAMWebAgentService\",
 or \"mypolicyset\"",
      "type" : "string"
    },
    "actionValues" : {
      "title" : "Action values",
      "description" : "Set of string action names, each set to a boolean indicating whether the action
 is allowed. Chosen from the available actions provided by the associated Managing Resource Types
 resource type",

```

--user

The User Policy resource endpoint is responsible for managing a user's policies. The available operations are create, read, update, delete, query. Policies are realm specific, hence the URI for the policies API can contain a realm component. If the realm is not specified in the URI, the top level realm is used.

UserRegistration

Realm Operations

Self Service endpoint for registering a new user

Resource path: `/selfservice/userRegistration`

Resource version: `1.0`

read

Initialise the user registration process.A set of requirements will be returned that will need to be fulfilled and sent to the submitRequirements action.

Usage:

```
am> read UserRegistration --realm Realm
```

submitRequirements

Submit some fulfilled requirements. Returns either a completion status, or a token along with some more requirements. If requirements are returned, they should be submitted with the token as a fresh request to this action.

Usage:

```
am> action UserRegistration --realm Realm --body body --actionName submitRequirements
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "$schema" : "http://json-schema.org/draft-04/schema#",
  "description" : "The structure of a request to the submitRequirements action.",
  "type" : "object",
  "title" : "Submit requirements structure",
  "properties" : {
    "token" : {
      "type" : "string",
      "title" : "Token",
      "description" : "The token returned from the previous submitRequirements request."
    },
    "input" : {
      "type" : "object",
      "title" : "Input",
      "description" : "The input as collected from the new user. This object must conform to the JSON
 Schema of the requirements property from the last response.",
      "patternProperties" : {
        ".*" : {
          "type" : "any",
          "title" : "Input Property",
          "description" : "Valid content according to the received JSON Schema."
        }
      }
    }
  },
  "required" : [ "input" ]
}
```

UserSelfService

Realm Operations

Resource path: `/realm-config/services/selfService`

Resource version: `1.0`

create

Usage:

```
am> create UserSelfService --realm Realm --body body
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
```

```
    "userRegistration" : {
      "type" : "object",

}
```

delete

Usage:

```
am> delete UserSelfService --realm Realm
```

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action UserSelfService --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action UserSelfService --realm Realm --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action UserSelfService --realm Realm --actionName nextdescendents
```

read

Usage:

```
am> read UserSelfService --realm Realm
```

update

Usage:

```
am> update UserSelfService --realm Realm --body body
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "userRegistration" : {
      "type" : "object",
      "title" : "User Registration",
      "propertyOrder" : 1,
      "properties" : {
        "userRegisteredDestination" : {
          "title" : "Destination After Successful Self-Registration",
```

```
          "description" : "Specifies the action to be taken after a user successfully registers
 a new account. Choose from:<ul><li><code>default</code>. User is sent to a success page without
 being logged in.</li><li><code>login</code>. User is sent to the login page to authenticate.</
li><li><code>autologin</code>. User is automatically logged in and sent to the appropriate page.</
li></ul>",

Global Operations

Resource path: `/global-config/services/selfService`

Resource version: `1.0`

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action UserSelfService --global --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action UserSelfService --global --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action UserSelfService --global --actionName nextdescendents
```

read

Usage:

```
am> read UserSelfService --global
```

update

Usage:

```
am> update UserSelfService --global --body body
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "defaults" : {
      "properties" : {
        "userRegistration" : {

}
```

UserServices

Realm Operations

Resource path: `/users/{user}/services`

Resource version: `1.0`

create

Usage:

```
am> create UserServices --realm Realm --body body
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object"
}
```

delete

Usage:

```
am> delete UserServices --realm Realm
```

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action UserServices --realm Realm --user user --actionName getAllTypes
```

Parameters:

--user

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action UserServices --realm Realm --user user --actionName getCreatableTypes
```

Parameters:

--user

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action UserServices --realm Realm --user user --actionName nextdescendents
```

Parameters:

--user

read

Usage:

```
am> read UserServices --realm Realm
```

unassignServices

action.unassignServices.description

Usage:

```
am> action UserServices --realm Realm --body body --user user --actionName unassignServices
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "description" : "i18n:api-descriptor/UserServicesResource#schema.description",
  "type" : "object",
  "title" : "i18n:api-descriptor/UserServicesResource#schema.title",
  "properties" : {
    "serviceNames" : {
      "type" : "array",
      "title" : "i18n:api-descriptor/UserServicesResource#schema.servicename.title",
      "description" : "i18n:api-descriptor/UserServicesResource#schema.servicename.description",
      "items" : {
        "type" : "string"
      }
    }
  }
}
```

--user

update

Usage:

```
am> update UserServices --realm Realm --body body
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object"
}
```

UsernameCollector

Realm Operations

Resource path: `/realm-config/authentication/authenticationtrees/nodes/UsernameCollectorNode`

Resource version: `1.0`

create

Usage:

```
am> create UsernameCollector --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "required" : [ ]
}
```

delete

Usage:

```
am> delete UsernameCollector --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action UsernameCollector --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action UsernameCollector --realm Realm --actionName getCreatableTypes
```

listOutcomes

List the available outcomes for the node type.

Usage:

```
am> action UsernameCollector --realm Realm --body body --actionName listOutcomes
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "title" : "Some configuration of the node. This does not need to be complete against the
 configuration schema."
}
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action UsernameCollector --realm Realm --actionName nextdescendents
```

query

Get the full list of instances of this collection. This query only supports `_queryFilter=true` filter.

Usage:

```
am> query UsernameCollector --realm Realm --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read UsernameCollector --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update UsernameCollector --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "required" : [ ]
}
```

VKClient

Realm Operations

Resource path: `/realm-config/services/SocialIdentityProviders/vkConfig`

Resource version: `1.0`

create

Usage:

```
am> create VKClient --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",

    }
  }
}
```

delete

Usage:

```
am> delete VKClient --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action VKClient --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action VKClient --realm Realm --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action VKClient --realm Realm --actionName nextdescendents
```

query

Get the full list of instances of this collection. This query only supports `_queryFilter=true` filter.

Usage:

```
am> query VKClient --realm Realm --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read VKClient --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update VKClient --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "userInfoEndpoint" : {
      "title" : "User Profile Service URL",

ValidationService

Realm Operations

Resource path: `/realm-config/services/validation`

Resource version: `1.0`

create

Usage:

```
am> create ValidationService --realm Realm --body body
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "validGotoDestinations" : {
      "title" : "Valid goto URL Resources",
      "description" : "List of valid goto URL resources.<br><br>Specifies a list of valid URLs for
 the <code>goto</code> and <code>gotoOnFail</code> query string parameters. AM only redirects a user
 after log in or log out to a URL in this list. If the URL is not in the list, AM redirects to either
 the user profile page, or the administration console. If this property is not set, AM will only allow
 URLs that match its domain; for example, <code>domain-of-am-instance.com</code>. Use the <code>*</
code> wildcard to match all characters except <code>?</code>.<p> Examples: </p> <ul><li><code>http://
app.example.com:80/*</code></li> <li><code>http://app.example.com:80/*?*</code></li></ul>",
      "propertyOrder" : 100,
      "required" : true,
      "items" : {
        "type" : "string"
      },
      "type" : "array",
      "exampleValue" : ""
    }
  }
}
```

delete

Usage:

```
am> delete ValidationService --realm Realm
```

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action ValidationService --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action ValidationService --realm Realm --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action ValidationService --realm Realm --actionName nextdescendents
```

read

Usage:

```
am> read ValidationService --realm Realm
```

update

Usage:

```
am> update ValidationService --realm Realm --body body
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "validGotoDestinations" : {
      "title" : "Valid goto URL Resources",
      "description" : "List of valid goto URL resources.<br><br>Specifies a list of valid URLs for
 the <code>goto</code> and <code>gotoOnFail</code> query string parameters. AM only redirects a user
 after log in or log out to a URL in this list. If the URL is not in the list, AM redirects to either
 the user profile page, or the administration console. If this property is not set, AM will only allow
 URLs that match its domain; for example, <code>domain-of-am-instance.com</code>. Use the <code>*</
code> wildcard to match all characters except <code>?</code>.<p> Examples: </p> <ul><li><code>http://
app.example.com:80/*</code></li> <li><code>http://app.example.com:80/*?*</code></li></ul>",
      "propertyOrder" : 100,
      "required" : true,
      "items" : {
        "type" : "string"
      },
      "type" : "array",
      "exampleValue" : ""
    }
  }
}
```

Global Operations

Resource path: `/global-config/services/validation`

Resource version: `1.0`

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action ValidationService --global --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action ValidationService --global --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action ValidationService --global --actionName nextdescendents
```

read

Usage:

```
am> read ValidationService --global
```

update

Usage:

```
am> update ValidationService --global --body body
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "defaults" : {
      "properties" : {
        "validGotoDestinations" : {
          "title" : "Valid goto URL Resources",
          "description" : "List of valid goto URL resources.<br><br>Specifies a list of valid URLs for
 the <code>goto</code> and <code>gotoOnFail</code> query string parameters. AM only redirects a user
 after log in or log out to a URL in this list. If the URL is not in the list, AM redirects to either
 the user profile page, or the administration console. If this property is not set, AM will only allow

  }
```

```
}
```

delete

Usage:

```
am> delete WeChatClient --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action WeChatClient --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action WeChatClient --realm Realm --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action WeChatClient --realm Realm --actionName nextdescendents
```

query

Get the full list of instances of this collection. This query only supports `_queryFilter=true` filter.

Usage:

```
am> query WeChatClient --realm Realm --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read WeChatClient --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update WeChatClient --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "authenticationIdKey" : {
      "title" : "Auth ID Key",

WebAgentGroups

Realm Operations

Agent Groups handler that is responsible for managing agent groups

Resource path: `/realm-config/agents/groups/WebAgent`

Resource version: `1.0`

create

Usage:

```
am> create WebAgentGroups --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "applicationWebAgentConfig" : {
      "type" : "object",
      "title" : "Application",
      "propertyOrder" : 1,
      "properties" : {
        "continuousSecurityCookies" : {
          "title" : "Continuous Security Cookies",
          "description" : "The name of the cookies to be sent as part of the payload during policy
 evaluation, which can be accessed via the 'environment' variable in a policy script. The 'key' is
 the name of the cookie to be sent, and the 'value' is the name which it will appear as in the policy
 evaluation script. It is possible to map multiple cookies to the same name (they will simply appear
```

```
as an array in the evaluation script). If the cookie doesn't exist, then the empty string will be
sent.",
         "propertyOrder" : 28900,
         "required" : false,

}
```

delete

Usage:

```
am> delete WebAgentGroups --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action WebAgentGroups --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action WebAgentGroups --realm Realm --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action WebAgentGroups --realm Realm --actionName nextdescendents
```

query

Querying the agent groups of a specific type

Usage:

```
am> query WebAgentGroups --realm Realm --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read WebAgentGroups --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update WebAgentGroups --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "applicationWebAgentConfig" : {

WebAgents

Realm Operations

Agents handler that is responsible for managing agents

Resource path: `/realm-config/agents/WebAgent`

Resource version: `1.0`

create

Usage:

```
am> create WebAgents --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "ssoWebAgentConfig" : {
      "type" : "object",
      "title" : "SSO",
      "propertyOrder" : 2,
      "properties" : {

}
```

delete

Usage:

```
am> delete WebAgents --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action WebAgents --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action WebAgents --realm Realm --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action WebAgents --realm Realm --actionName nextdescendents
```

query

Querying the agents of a specific type

Usage:

```
am> query WebAgents --realm Realm --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read WebAgents --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update WebAgents --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{

WebAuthnAuthenticationNode

Realm Operations

Resource path: `/realm-config/authentication/authenticationtrees/nodes/WebAuthnAuthenticationNode`

Resource version: `1.0`

create

Usage:

```
am> create WebAuthnAuthenticationNode --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "isRecoveryCodeAllowed" : {
      "title" : "Allow recovery codes",
      "description" : "",
      "propertyOrder" : 30,
      "type" : "boolean",
      "exampleValue" : ""
    },
    "asScript" : {
      "title" : "Return challenge as JavaScript",
      "description" : "If enabled, the node will return its challenge as a fully encapsulated client-
side JavaScript that will interact directly with the WebAuthn API and submit the response back. If
 disabled, the node will return the challenge and associated data in a metadata node, and the custom
 UI will use that to interact with the WebAuthn API itself.",
      "propertyOrder" : 60,
      "type" : "boolean",
      "exampleValue" : ""
    },

```

delete

Usage:

```
am> delete WebAuthnAuthenticationNode --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action WebAuthnAuthenticationNode --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action WebAuthnAuthenticationNode --realm Realm --actionName getCreatableTypes
```

listOutcomes

List the available outcomes for the node type.

Usage:

```
am> action WebAuthnAuthenticationNode --realm Realm --body body --actionName listOutcomes
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "title" : "Some configuration of the node. This does not need to be complete against the
 configuration schema."
}
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action WebAuthnAuthenticationNode --realm Realm --actionName nextdescendents
```

query

Get the full list of instances of this collection. This query only supports `_queryFilter=true` filter.

Usage:

```
am> query WebAuthnAuthenticationNode --realm Realm --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read WebAuthnAuthenticationNode --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update WebAuthnAuthenticationNode --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "isRecoveryCodeAllowed" : {
      "title" : "Allow recovery codes",
      "description" : "",
      "propertyOrder" : 30,
      "type" : "boolean",
      "exampleValue" : ""
    },
    "asScript" : {
      "title" : "Return challenge as JavaScript",
      "description" : "If enabled, the node will return its challenge as a fully encapsulated client-
side JavaScript that will interact directly with the WebAuthn API and submit the response back. If
 disabled, the node will return the challenge and associated data in a metadata node, and the custom
 UI will use that to interact with the WebAuthn API itself.",
      "propertyOrder" : 60,
      "type" : "boolean",
      "exampleValue" : ""
    },
    "relyingPartyDomain" : {

WebAuthnDeviceStorageNode

Realm Operations

Resource path: `/realm-config/authentication/authenticationtrees/nodes/WebAuthnDeviceStorageNode`

Resource version: `1.0`

create

Usage:

```
am> create WebAuthnDeviceStorageNode --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "generateRecoveryCodes" : {
      "title" : "Generate recovery codes",
      "description" : "If enabled, the success outcome's transient state will contain a set of
 recovery codes. If this success outcome is passed into a Recovery Code Display Node, these codes will
 be presented to the user. A user may use recovery codes to bypass the WebAuthn authentication node in
 the event they have lost their authenticator. A set of recovery codes is shared among all registered
 WebAuthn authenticators, with the latest-generated set being the only valid set of codes.",
      "propertyOrder" : 10,
      "type" : "boolean",
      "exampleValue" : ""
    }
  },
  "required" : [ "generateRecoveryCodes" ]
}
```

delete

Usage:

```
am> delete WebAuthnDeviceStorageNode --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action WebAuthnDeviceStorageNode --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action WebAuthnDeviceStorageNode --realm Realm --actionName getCreatableTypes
```

listOutcomes

List the available outcomes for the node type.

Usage:

```
am> action WebAuthnDeviceStorageNode --realm Realm --body body --actionName listOutcomes
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "title" : "Some configuration of the node. This does not need to be complete against the
 configuration schema."
}
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action WebAuthnDeviceStorageNode --realm Realm --actionName nextdescendents
```

query

Get the full list of instances of this collection. This query only supports `_queryFilter=true` filter.

Usage:

```
am> query WebAuthnDeviceStorageNode --realm Realm --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read WebAuthnDeviceStorageNode --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update WebAuthnDeviceStorageNode --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "generateRecoveryCodes" : {
      "title" : "Generate recovery codes",
      "description" : "If enabled, the success outcome's transient state will contain a set of
 recovery codes. If this success outcome is passed into a Recovery Code Display Node, these codes will
 be presented to the user. A user may use recovery codes to bypass the WebAuthn authentication node in
 the event they have lost their authenticator. A set of recovery codes is shared among all registered
 WebAuthn authenticators, with the latest-generated set being the only valid set of codes.",

WebAuthnUserDevices

Realm Operations

The WebAuthn devices service is responsible for exposing functions to change the collection of WebAuthn authentication devices. The supported methods are update, delete, query

Resource path: `/users/{user}/devices/2fa/webauthn`

Resource version: `1.0`

delete

Delete WebAuthn user device

Usage:

```
am> delete WebAuthnUserDevices --realm Realm --id id --user user
```

Parameters:

`--id`

The unique identifier for the resource.

`--user`

The WebAuthn devices service is responsible for exposing functions to change the collection of WebAuthn authentication devices. The supported methods are update, delete, query

query

Query the user's WebAuthn devices

Usage:

```
am> query WebAuthnUserDevices --realm Realm --filter filter --user user
```

Parameters:

`--filter`

A CREST formatted query filter, where "true" will query all. Fields that can be queried: [*]

--user

The WebAuthn devices service is responsible for exposing functions to change the collection of WebAuthn authentication devices. The supported methods are update, delete, query

update

Update an existing WebAuthn user device

Usage:

```
am> update WebAuthnUserDevices --realm Realm --id id --body body --user user
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "$schema" : "http://json-schema.org/draft-04/schema#",
  "description" : "User devices schema that is used for WebAuthn authentication devices",
  "type" : "object",
  "title" : "User devices schema",
  "properties" : {
    "deviceName" : {
      "type" : "string",
      "title" : "Device Name",
      "description" : "The name of the WebAuthn device."
    },
    "uuid" : {
      "type" : "string",
      "title" : "UUID",
      "description" : "The unique identifier for this device."
    }
  }
}
```

--user

The WebAuthn devices service is responsible for exposing functions to change the collection of WebAuthn authentication devices. The supported methods are update, delete, query

WebhookService

Realm Operations

Resource path: `/realm-config/webhooks`

Resource version: `1.0`

create

Usage:

```
am> create WebhookService --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "body" : {
      "title" : "Body",
      "description" : "The webhook body to be sent in the http request.",
      "propertyOrder" : 200,
      "required" : true,
      "type" : "string",
      "exampleValue" : ""
    },
    "headers" : {
      "title" : "Headers",
      "description" : "The webhook headers added to the http request.",
      "propertyOrder" : 300,
      "required" : true,
      "patternProperties" : {
        ".*" : {
          "type" : "string"
        }
      },
      "type" : "object",
      "exampleValue" : ""
    },
    "url" : {
      "title" : "Url",
      "description" : "The webhook url that is used to create the http call for this webhook.",
      "propertyOrder" : 100,
      "required" : true,
      "type" : "string",
      "exampleValue" : ""
    }
  }
```

```
}
```

delete

Usage:

```
am> delete WebhookService --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action WebhookService --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action WebhookService --realm Realm --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action WebhookService --realm Realm --actionName nextdescendents
```

query

Get the full list of instances of this collection. This query only supports `_queryFilter=true` filter.

Usage:

```
am> query WebhookService --realm Realm --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read WebhookService --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update WebhookService --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "body" : {
      "title" : "Body",
      "description" : "The webhook body to be sent in the http request.",
      "propertyOrder" : 200,
      "required" : true,
      "type" : "string",
      "exampleValue" : ""
    },
    "headers" : {
      "title" : "Headers",
      "description" : "The webhook headers added to the http request.",
      "propertyOrder" : 300,
```

```
      "required" : true,
      "patternProperties" : {
        ".*" : {
          "type" : "string"
        }
      },
      "type" : "object",
      "exampleValue" : ""
    },
    "url" : {
      "title" : "Url",
      "description" : "The webhook url that is used to create the http call for this webhook.",
      "propertyOrder" : 100,
      "required" : true,
      "type" : "string",
      "exampleValue" : ""
    }
  }
}
```

Global Operations

Resource path: `/global-config/webhooks`

Resource version: `1.0`

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action WebhookService --global --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action WebhookService --global --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action WebhookService --global --actionName nextdescendents
```

read

Usage:

```
am> read WebhookService --global
```

update

Usage:

```
am> update WebhookService --global --body body
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object"
}
```

WindowsDesktopSsoModule

Realm Operations

Resource path: `/realm-config/authentication/modules/windowsdesktopsso`

Resource version: `1.0`

create

Usage:

```
am> create WindowsDesktopSsoModule --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "trustedKerberosRealms" : {
      "title" : "Trusted Kerberos realms",
      "description" : "List of trusted Kerberos realms for User Kerberos tickets.<br><br>If realms are
 configured, then Kerberos tickets are only accepted if the realm part of the UserPrincipalName of the
 Users Kerberos ticket matches a realm from the list.",

      "type" : "boolean",
      "exampleValue" : ""
    }
  }
}
```

delete

Usage:

```
am> delete WindowsDesktopSsoModule --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action WindowsDesktopSsoModule --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action WindowsDesktopSsoModule --realm Realm --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action WindowsDesktopSsoModule --realm Realm --actionName nextdescendents
```

query

Get the full list of instances of this collection. This query only supports `_queryFilter=true` filter.

Usage:

```
am> query WindowsDesktopSsoModule --realm Realm --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read WindowsDesktopSsoModule --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update WindowsDesktopSsoModule --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```

```

WindowsNtModule

Realm Operations

Resource path: `/realm-config/authentication/modules/windowsnt`

Resource version: `1.0`

create

Usage:

```
am> create WindowsNtModule --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "sambaConfigurationFileName" : {
      "title" : "Samba Configuration File Name",
      "description" : "The path to the Samba configuration file.<br><br>The Windows NT authentication
 module uses the <code>smbclient</code> command to validate the user credentials against the Windows
 domain controller. <br/><br/>For example: <code>/opt/openam/smb.conf</code><br/><br/><i>NB </i>The
 <code>smbclient</code> command must be available in the <code>PATH</code> environmental variable
 associated with OpenAM.",
      "propertyOrder" : 300,
      "required" : true,
      "type" : "string",
      "exampleValue" : ""
    },
    "authenticationDomain" : {
      "title" : "Authentication Domain",
      "description" : "The name of the Windows Domain used for authentication",
      "propertyOrder" : 100,
      "required" : true,
      "type" : "string",
      "exampleValue" : ""
    },
    "authenticationLevel" : {
      "title" : "Authentication Level",
      "description" : "The authentication level associated with this module.<br><br>Each
 authentication module has an authentication level that can be used to indicate the level of security
 associated with the module; 0 is the lowest (and the default). ",
      "propertyOrder" : 400,
      "required" : true,
      "type" : "integer",
      "exampleValue" : ""
    },
    "authenticationHost" : {
      "title" : "Authentication Host",
      "description" : "The name of the Windows NT Domain Controller.",
      "propertyOrder" : 200,
      "required" : true,
      "type" : "string",
      "exampleValue" : ""
    }
  }
}
```

delete

Usage:

```
am> delete WindowsNtModule --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action WindowsNtModule --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action WindowsNtModule --realm Realm --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action WindowsNtModule --realm Realm --actionName nextdescendents
```

query

Get the full list of instances of this collection. This query only supports `_queryFilter=true` filter.

Usage:

```
am> query WindowsNtModule --realm Realm --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read WindowsNtModule --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update WindowsNtModule --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "sambaConfigurationFileName" : {
      "title" : "Samba Configuration File Name",
      "description" : "The path to the Samba configuration file.<br><br>The Windows NT authentication
 module uses the <code>smbclient</code> command to validate the user credentials against the Windows
 domain controller. <br/><br/>For example: <code>/opt/openam/smb.conf</code><br/><br/><i>NB </i>The
 <code>smbclient</code> command must be available in the <code>PATH</code> environmental variable
 associated with OpenAM.",
      "propertyOrder" : 300,
      "required" : true,
      "type" : "string",
      "exampleValue" : ""
    },
    "authenticationDomain" : {
      "title" : "Authentication Domain",
      "description" : "The name of the Windows Domain used for authentication",
      "propertyOrder" : 100,
      "required" : true,
      "type" : "string",
      "exampleValue" : ""
    },
    "authenticationLevel" : {
```

```
      "title" : "Authentication Level",
      "description" : "The authentication level associated with this module.<br><br>Each
 authentication module has an authentication level that can be used to indicate the level of security
 associated with the module; 0 is the lowest (and the default). ",
      "propertyOrder" : 400,
      "required" : true,
      "type" : "integer",
      "exampleValue" : ""
    },
    "authenticationHost" : {
      "title" : "Authentication Host",
      "description" : "The name of the Windows NT Domain Controller.",
      "propertyOrder" : 200,
      "required" : true,
      "type" : "string",
      "exampleValue" : ""
    }
  }
}
```

Global Operations

Resource path: `/global-config/authentication/modules/windowsnt`

Resource version: `1.0`

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action WindowsNtModule --global --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action WindowsNtModule --global --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action WindowsNtModule --global --actionName nextdescendents
```

read

Usage:

```
am> read WindowsNtModule --global
```

update

Usage:

```
am> update WindowsNtModule --global --body body
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "defaults" : {
      "properties" : {
        "authenticationHost" : {
          "title" : "Authentication Host",
          "description" : "The name of the Windows NT Domain Controller.",
          "propertyOrder" : 200,
          "required" : true,
          "type" : "string",
          "exampleValue" : ""
        },
        "authenticationDomain" : {
          "title" : "Authentication Domain",
          "description" : "The name of the Windows Domain used for authentication",
          "propertyOrder" : 100,
          "required" : true,
          "type" : "string",
          "exampleValue" : ""
        },
        "authenticationLevel" : {
          "title" : "Authentication Level",
          "description" : "The authentication level associated with this module.<br><br>Each
 authentication module has an authentication level that can be used to indicate the level of security
 associated with the module; 0 is the lowest (and the default). ",
          "propertyOrder" : 400,
          "required" : true,
          "type" : "integer",
          "exampleValue" : ""
        },
        "sambaConfigurationFileName" : {
          "title" : "Samba Configuration File Name",
          "description" : "The path to the Samba configuration file.<br><br>The Windows NT
 authentication module uses the <code>smbclient</code> command to validate the user credentials
 against the Windows domain controller. <br/><br/>For example: <code>/opt/openam/smb.conf</code><br/
```

```
><br/><i>NB </i>The <code>smbclient</code> command must be available in the <code>PATH</code>
 environmental variable associated with OpenAM.",
          "propertyOrder" : 300,
          "required" : true,
          "type" : "string",
          "exampleValue" : ""
        }
      },
      "type" : "object",
      "title" : "Realm Defaults"
    }
  }
}
```

WriteFederationInformation

Realm Operations

Resource path: `/realm-config/authentication/authenticationtrees/nodes/product-WriteFederationInformationNode`

Resource version: `1.0`

create

Usage:

```
am> create WriteFederationInformation --realm Realm --id id --body body
```

Parameters:

`--id`

The unique identifier for the resource.

`--body`

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "required" : [ ]
}
```

delete

Usage:

```
am> delete WriteFederationInformation --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action WriteFederationInformation --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action WriteFederationInformation --realm Realm --actionName getCreatableTypes
```

listOutcomes

List the available outcomes for the node type.

Usage:

```
am> action WriteFederationInformation --realm Realm --body body --actionName listOutcomes
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "title" : "Some configuration of the node. This does not need to be complete against the
 configuration schema."
}
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action WriteFederationInformation --realm Realm --actionName nextdescendents
```

query

Get the full list of instances of this collection. This query only supports `_queryFilter=true` filter.

Usage:

```
am> query WriteFederationInformation --realm Realm --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read WriteFederationInformation --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update WriteFederationInformation --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "required" : [ ]
}
```

WsEntity

Realm Operations

Resource path: `/realm-config/federation/entityproviders/ws`

Resource version: `1.0`

create

Usage:

```
am> create WsEntity --realm Realm --id id --body body
```

Parameters:

`--id`

The unique identifier for the resource.

`--body`

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "entityConfig" : {
      "title" : "Entity Configuration",
      "description" : "",
      "propertyOrder" : 200,
      "required" : true,
      "type" : "string",
      "exampleValue" : ""
    },
    "metadata" : {
      "title" : "Metadata",
      "description" : "",
      "propertyOrder" : 100,
      "required" : true,
      "type" : "string",
      "exampleValue" : ""
    }
  }
}
```

delete

Usage:

```
am> delete WsEntity --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

query

Get the full list of instances of this collection. This query only supports `_queryFilter=true` filter.

Usage:

```
am> query WsEntity --realm Realm --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read WsEntity --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update WsEntity --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "entityConfig" : {
      "title" : "Entity Configuration",
      "description" : "",
      "propertyOrder" : 200,
      "required" : true,
      "type" : "string",
      "exampleValue" : ""
    },
    "metadata" : {
      "title" : "Metadata",
      "description" : "",
      "propertyOrder" : 100,
      "required" : true,
      "type" : "string",
      "exampleValue" : ""
    }
  }
}
```

ZeroPageLoginCollector

Realm Operations

Resource path: `/realm-config/authentication/authenticationtrees/nodes/ZeroPageLoginNode`

Resource version: `1.0`

create

Usage:

```
am> create ZeroPageLoginCollector --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "referrerWhiteList" : {
      "title" : "Referer Whitelist",
      "description" : "",
      "propertyOrder" : 400,
      "items" : {
        "type" : "string"
      },
      "type" : "array",
      "exampleValue" : ""
    },
    "allowWithoutReferer" : {
      "title" : "Allow Without Referer",
      "description" : "",
      "propertyOrder" : 300,
      "type" : "boolean",
      "exampleValue" : ""
    },
    "passwordHeader" : {
      "title" : "Password Header Name",
      "description" : "",
      "propertyOrder" : 200,
      "type" : "string",
      "exampleValue" : ""
    },
    "usernameHeader" : {
      "title" : "Username Header Name",
      "description" : "",
      "propertyOrder" : 100,
      "type" : "string",
      "exampleValue" : ""
    }
  },
  "required" : [ "referrerWhiteList", "passwordHeader", "usernameHeader", "allowWithoutReferer" ]
}
```

delete

Usage:

```
am> delete ZeroPageLoginCollector --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action ZeroPageLoginCollector --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action ZeroPageLoginCollector --realm Realm --actionName getCreatableTypes
```

listOutcomes

List the available outcomes for the node type.

Usage:

```
am> action ZeroPageLoginCollector --realm Realm --body body --actionName listOutcomes
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "title" : "Some configuration of the node. This does not need to be complete against the
 configuration schema."
}
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action ZeroPageLoginCollector --realm Realm --actionName nextdescendents
```

query

Get the full list of instances of this collection. This query only supports `_queryFilter=true` filter.

Usage:

```
am> query ZeroPageLoginCollector --realm Realm --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read ZeroPageLoginCollector --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update ZeroPageLoginCollector --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "referrerWhiteList" : {
      "title" : "Referer Whitelist",
      "description" : "",
      "propertyOrder" : 400,
      "items" : {
        "type" : "string"
      },
      "type" : "array",
      "exampleValue" : ""
    },
    "allowWithoutReferer" : {
      "title" : "Allow Without Referer",
      "description" : "",
      "propertyOrder" : 300,
      "type" : "boolean",
      "exampleValue" : ""
```

```
    },
    "passwordHeader" : {
      "title" : "Password Header Name",
      "description" : "",
      "propertyOrder" : 200,
      "type" : "string",
      "exampleValue" : ""
    },
    "usernameHeader" : {
      "title" : "Username Header Name",
      "description" : "",
      "propertyOrder" : 100,
      "type" : "string",
      "exampleValue" : ""
    }
  },
  "required" : [ "referrerWhiteList", "passwordHeader", "usernameHeader", "allowWithoutReferer" ]
}
```
