Abstract

Reference of the ForgeRock® Access Management command-line interface entities.

Table of Contents

Overview

This reference contains:

- Entities supported in Amster commands
- Actions you can perform with Amster commands.

About ForgeRock Identity Platform™ Software

ForgeRock Identity Platform™ serves as the basis for our simple and comprehensive Identity and Access Management solution. We help our customers deepen their relationships with their customers, and improve the productivity and connectivity of their employees and partners. For more information about ForgeRock and about the platform, see https://www.forgerock.com.

Chapter 1

Amster Entity Reference

This chapter contains details of the entities available to Amster in AM 7.

AcceptTermsAndConditions

Realm Operations

Resource path: `/realm-config/authentication/authenticationtrees/nodes/AcceptTermsAndConditionsNode`

Resource version: `1.0`

create

Usage:

```
am> create AcceptTermsAndConditions --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "required" : [ ]
}
```

delete

Usage:

```
am> delete AcceptTermsAndConditions --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action AcceptTermsAndConditions --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action AcceptTermsAndConditions --realm Realm --actionName getCreatableTypes
```

listOutcomes

List the available outcomes for the node type.

Usage:

```
am> action AcceptTermsAndConditions --realm Realm --body body --actionName listOutcomes
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "title" : "Some configuration of the node. This does not need to be complete against the
 configuration schema."
}
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action AcceptTermsAndConditions --realm Realm --actionName nextdescendents
```

query

Get the full list of instances of this collection. This query only supports `_queryFilter=true` filter.

Usage:

```
am> query AcceptTermsAndConditions --realm Realm --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read AcceptTermsAndConditions --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update AcceptTermsAndConditions --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "required" : [ ]
}
```

AccountActiveCheck

Realm Operations

Resource path: `/realm-config/authentication/modules/accountactivecheck`

Resource version: `1.0`

create

Usage:

```
am> create AccountActiveCheck --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "authenticationLevel" : {
      "title" : "Authentication Level",
      "description" : "The authentication level associated with this module.<br><br>Each
 authentication module has an authentication level that can be used to indicate the level of security
 associated with the module; 0 is the lowest (and the default).",
      "propertyOrder" : null,
      "required" : true,
      "type" : "integer",
      "exampleValue" : ""
    }
  }
}
```

delete

Usage:

```
am> delete AccountActiveCheck --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action AccountActiveCheck --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action AccountActiveCheck --realm Realm --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action AccountActiveCheck --realm Realm --actionName nextdescendents
```

query

Get the full list of instances of this collection. This query only supports `_queryFilter=true` filter.

Usage:

```
am> query AccountActiveCheck --realm Realm --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read AccountActiveCheck --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update AccountActiveCheck --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "authenticationLevel" : {
      "title" : "Authentication Level",
      "description" : "The authentication level associated with this module.<br><br>Each
 authentication module has an authentication level that can be used to indicate the level of security
 associated with the module; 0 is the lowest (and the default).",
      "propertyOrder" : null,
      "required" : true,
      "type" : "integer",
      "exampleValue" : ""
    }
  }
}
```

Global Operations

Resource path: `/global-config/authentication/modules/accountactivecheck`

Resource version: `1.0`

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action AccountActiveCheck --global --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action AccountActiveCheck --global --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action AccountActiveCheck --global --actionName nextdescendents
```

read

Usage:

```
am> read AccountActiveCheck --global
```

update

Usage:

```
am> update AccountActiveCheck --global --body body
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "defaults" : {
      "properties" : {
        "authenticationLevel" : {
          "title" : "Authentication Level",
          "description" : "The authentication level associated with this module.<br><br>Each
 authentication module has an authentication level that can be used to indicate the level of security
 associated with the module; 0 is the lowest (and the default).",
          "propertyOrder" : null,
          "required" : true,
          "type" : "integer",
          "exampleValue" : ""
        }
      },
      "type" : "object",
      "title" : "Realm Defaults"
    }
  }
}
```

AccountActiveDecision

Realm Operations

Resource path: `/realm-config/authentication/authenticationtrees/nodes/AccountActiveDecisionNode`

Resource version: `1.0`

create

Usage:

```
am> create AccountActiveDecision --realm Realm --id id --body body
```

Parameters:

`--id`

The unique identifier for the resource.

`--body`

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "required" : [ ]
}
```

delete

Usage:

```
am> delete AccountActiveDecision --realm Realm --id id
```

Parameters:

`--id`

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action AccountActiveDecision --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action AccountActiveDecision --realm Realm --actionName getCreatableTypes
```

listOutcomes

List the available outcomes for the node type.

Usage:

```
am> action AccountActiveDecision --realm Realm --body body --actionName listOutcomes
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "title" : "Some configuration of the node. This does not need to be complete against the
 configuration schema."
}
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action AccountActiveDecision --realm Realm --actionName nextdescendents
```

query

Get the full list of instances of this collection. This query only supports `_queryFilter=true` filter.

Usage:

```
am> query AccountActiveDecision --realm Realm --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read AccountActiveDecision --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update AccountActiveDecision --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "required" : [ ]
}
```

AccountLockout

Realm Operations

Resource path: `/realm-config/authentication/authenticationtrees/nodes/AccountLockoutNode`

Resource version: `1.0`

create

Usage:

```
am> create AccountLockout --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "lockAction" : {
      "title" : "Lock Action",
      "description" : "If the action is set to LOCK, the node will lock the account.",
      "propertyOrder" : 100,
      "type" : "string",
      "exampleValue" : ""
    }
  },
  "required" : [ "lockAction" ]
}
```

delete

Usage:

```
am> delete AccountLockout --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action AccountLockout --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action AccountLockout --realm Realm --actionName getCreatableTypes
```

listOutcomes

List the available outcomes for the node type.

Usage:

```
am> action AccountLockout --realm Realm --body body --actionName listOutcomes
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "title" : "Some configuration of the node. This does not need to be complete against the
 configuration schema."
}
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action AccountLockout --realm Realm --actionName nextdescendents
```

query

Get the full list of instances of this collection. This query only supports `_queryFilter=true` filter.

Usage:

```
am> query AccountLockout --realm Realm --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read AccountLockout --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update AccountLockout --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "lockAction" : {
      "title" : "Lock Action",
      "description" : "If the action is set to LOCK, the node will lock the account.",
      "propertyOrder" : 100,
      "type" : "string",
      "exampleValue" : ""
    }
  },
  "required" : [ "lockAction" ]
}
```

ActiveDirectory

Realm Operations

Resource path: `/realm-config/services/id-repositories/LDAPv3ForAD`

Resource version: `1.0`

create

Usage:

```
am> create ActiveDirectory --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "pluginconfig" : {
      "type" : "object",
      "title" : "Plug-in Configuration",
      "propertyOrder" : 2,
      "properties" : {
        "sunIdRepoClass" : {
          "title" : "LDAPv3 Repository Plug-in Class Name",
          "description" : "",
          "propertyOrder" : 1700,
          "required" : true,
          "type" : "string",
          "exampleValue" : ""
        },
        "sunIdRepoSupportedOperations" : {
          "title" : "LDAPv3 Plug-in Supported Types and Operations",
          "description" : "",
          "propertyOrder" : 1900,
          "required" : false,
          "items" : {
            "type" : "string"
          },
          "type" : "array",
          "exampleValue" : ""
        },
        "sunIdRepoAttributeMapping" : {
          "title" : "Attribute Name Mapping",
          "description" : "",
          "propertyOrder" : 1800,
          "required" : false,
          "items" : {
            "type" : "string"
          },
          "type" : "array",
          "exampleValue" : ""
        }
      }
    },
    "userconfig" : {
      "type" : "object",

```

```
  }
}
```

delete

Usage:

```
am> delete ActiveDirectory --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action ActiveDirectory --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action ActiveDirectory --realm Realm --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action ActiveDirectory --realm Realm --actionName nextdescendents
```

query

Get the full list of instances of this collection. This query only supports `_queryFilter=true` filter.

Usage:

```
am> query ActiveDirectory --realm Realm --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read ActiveDirectory --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update ActiveDirectory --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```

ActiveDirectoryApplicationModeADAM

Realm Operations

Resource path: `/realm-config/services/id-repositories/LDAPv3ForADAM`

Resource version: `1.0`

create

Usage:

```
am> create ActiveDirectoryApplicationModeADAM --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "cachecontrol" : {
      "type" : "object",

  }
}
```

delete

Usage:

```
am> delete ActiveDirectoryApplicationModeADAM --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action ActiveDirectoryApplicationModeADAM --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action ActiveDirectoryApplicationModeADAM --realm Realm --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action ActiveDirectoryApplicationModeADAM --realm Realm --actionName nextdescendents
```

query

Get the full list of instances of this collection. This query only supports `_queryFilter=true` filter.

Usage:

```
am> query ActiveDirectoryApplicationModeADAM --realm Realm --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read ActiveDirectoryApplicationModeADAM --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update ActiveDirectoryApplicationModeADAM --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "cachecontrol" : {
      "type" : "object",

ActiveDirectoryModule

Realm Operations

Resource path: `/realm-config/authentication/modules/activedirectory`

Resource version: `1.0`

create

Usage:

```
am> create ActiveDirectoryModule --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "trustAllServerCertificates" : {
      "title" : "Trust All Server Certificates",

    }
  }
}
```

delete

Usage:

```
am> delete ActiveDirectoryModule --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action ActiveDirectoryModule --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action ActiveDirectoryModule --realm Realm --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action ActiveDirectoryModule --realm Realm --actionName nextdescendents
```

query

Get the full list of instances of this collection. This query only supports `_queryFilter=true` filter.

Usage:

```
am> query ActiveDirectoryModule --realm Realm --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read ActiveDirectoryModule --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update ActiveDirectoryModule --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{

Global Operations

Resource path: `/global-config/authentication/modules/activedirectory`

Resource version: `1.0`

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action ActiveDirectoryModule --global --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action ActiveDirectoryModule --global --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action ActiveDirectoryModule --global --actionName nextdescendents
```

read

Usage:

```
am> read ActiveDirectoryModule --global
```

update

Usage:

```
am> update ActiveDirectoryModule --global --body body
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```

AdaptiveRiskModule

Realm Operations

Resource path: `/realm-config/authentication/modules/adaptiverisk`

Resource version: `1.0`

create

Usage:

```
am> create AdaptiveRiskModule --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "attributecheck" : {
      "type" : "object",

delete

Usage:

```
am> delete AdaptiveRiskModule --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action AdaptiveRiskModule --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action AdaptiveRiskModule --realm Realm --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action AdaptiveRiskModule --realm Realm --actionName nextdescendents
```

query

Get the full list of instances of this collection. This query only supports `_queryFilter=true` filter.

Usage:

```
am> query AdaptiveRiskModule --realm Realm --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read AdaptiveRiskModule --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update AdaptiveRiskModule --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```

Global Operations

Resource path: `/global-config/authentication/modules/adaptiverisk`

Resource version: `1.0`

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action AdaptiveRiskModule --global --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action AdaptiveRiskModule --global --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action AdaptiveRiskModule --global --actionName nextdescendents
```

read

Usage:

```
am> read AdaptiveRiskModule --global
```

update

Usage:

```
am> update AdaptiveRiskModule --global --body body
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",

```

AdvancedProperties

Global Operations

An object of property key-value pairs

Resource path: `/global-config/servers/{serverName}/properties/advanced`

Resource version: `1.0`

read

Usage:

```
am> read AdvancedProperties --global --serverName serverName
```

Parameters:

`--serverName`

An object of property key-value pairs

update

Usage:

```
am> update AdvancedProperties --global --serverName serverName --body body
```

Parameters:

`--serverName`

An object of property key-value pairs

`--body`

The resource in JSON format, described by the following JSON schema:

```
{
  "patternProperties" : {
    ".+" : {
      "type" : "string",
      "title" : "Value",
      "description" : "Any string value"
    }
  },
  "$schema" : "http://json-schema.org/draft-04/schema#",
  "description" : "An object of property key-value pairs",
  "type" : "object",
  "title" : "Advanced Properties"
}
```

AgentDataStoreDecision

Realm Operations

Resource path: `/realm-config/authentication/authenticationtrees/nodes/AgentDataStoreDecisionNode`

Resource version: `1.0`

create

Usage:

```
am> create AgentDataStoreDecision --realm Realm --id id --body body
```

Parameters:

`--id`

The unique identifier for the resource.

`--body`

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "required" : [ ]
}
```

delete

Usage:

```
am> delete AgentDataStoreDecision --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action AgentDataStoreDecision --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action AgentDataStoreDecision --realm Realm --actionName getCreatableTypes
```

listOutcomes

List the available outcomes for the node type.

Usage:

```
am> action AgentDataStoreDecision --realm Realm --body body --actionName listOutcomes
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "title" : "Some configuration of the node. This does not need to be complete against the
 configuration schema."
}
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action AgentDataStoreDecision --realm Realm --actionName nextdescendents
```

query

Get the full list of instances of this collection. This query only supports `_queryFilter=true` filter.

Usage:

```
am> query AgentDataStoreDecision --realm Realm --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read AgentDataStoreDecision --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update AgentDataStoreDecision --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "required" : [ ]
}
```

AgentGroups

Realm Operations

Aggregating Agent Groups handler that is responsible for querying the aggregating agent groups

Resource path: `/realm-config/agents/groups`

Resource version: `1.0`

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action AgentGroups --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action AgentGroups --realm Realm --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action AgentGroups --realm Realm --actionName nextdescendents
```

query

Querying the aggregating agent groups

Usage:

```
am> query AgentGroups --realm Realm --filter filter
```

Parameters:

`--filter`

A CREST formatted query filter, where "true" will query all. Fields that can be queried: [*]

AgentService

Global Operations

Resource path: `/global-config/agents/AgentService`

Resource version: `1.0`

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action AgentService --global --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action AgentService --global --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action AgentService --global --actionName nextdescendents
```

read

Usage:

```
am> read AgentService --global
```

update

Usage:

```
am> update AgentService --global --body body
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object"
}
```

Agents

Realm Operations

Aggregating Agents handler that is responsible for querying the aggregating agents

Resource path: `/realm-config/agents`

Resource version: `1.0`

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action Agents --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action Agents --realm Realm --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action Agents --realm Realm --actionName nextdescendents
```

query

Querying the aggregating agents

Usage:

```
am> query Agents --realm Realm --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all. Fields that can be queried: [*]

Global Operations

Global and default configuration for agents

Resource path: `/global-config/agents`

Resource version: `1.0`

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action Agents --global --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action Agents --global --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action Agents --global --actionName nextdescendents
```

AmsterModule

Realm Operations

Resource path: `/realm-config/authentication/modules/amster`

Resource version: `1.0`

create

Usage:

```
am> create AmsterModule --realm Realm --id id --body body
```

Parameters:

`--id`

The unique identifier for the resource.

`--body`

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "authorizedKeys" : {
      "title" : "Authorized Keys",
      "description" : "The location of the authorized_keys file (which has the same format as an
 OpenSSH authorized_keys file) to use to validate remote Amster connections.",
      "propertyOrder" : 100,
      "required" : true,
      "type" : "string",
      "exampleValue" : ""
    },
    "enabled" : {
      "title" : "Enabled",
      "description" : "If not enabled, prevents PKI login using the Amster module.",
      "propertyOrder" : 200,
      "required" : true,
      "type" : "boolean",
      "exampleValue" : ""
    },
    "authenticationLevel" : {
      "title" : "Authentication Level",
      "description" : "",
      "propertyOrder" : 300,
      "required" : true,
      "type" : "integer",
      "exampleValue" : ""
    }
  }
}
```

delete

Usage:

```
am> delete AmsterModule --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action AmsterModule --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action AmsterModule --realm Realm --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action AmsterModule --realm Realm --actionName nextdescendents
```

query

Get the full list of instances of this collection. This query only supports `_queryFilter=true` filter.

Usage:

```
am> query AmsterModule --realm Realm --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read AmsterModule --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update AmsterModule --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "authorizedKeys" : {
      "title" : "Authorized Keys",
      "description" : "The location of the authorized_keys file (which has the same format as an
 OpenSSH authorized_keys file) to use to validate remote Amster connections.",
      "propertyOrder" : 100,
      "required" : true,
      "type" : "string",
      "exampleValue" : ""
    },
    "enabled" : {
      "title" : "Enabled",
      "description" : "If not enabled, prevents PKI login using the Amster module.",
      "propertyOrder" : 200,
      "required" : true,
      "type" : "boolean",
      "exampleValue" : ""
    },
    "authenticationLevel" : {
      "title" : "Authentication Level",
      "description" : "",
      "propertyOrder" : 300,

      "exampleValue" : ""
    }
  }
}
```

Global Operations

Resource path: `/global-config/authentication/modules/amster`

Resource version: `1.0`

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action AmsterModule --global --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action AmsterModule --global --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action AmsterModule --global --actionName nextdescendents
```

read

Usage:

```
am> read AmsterModule --global
```

update

Usage:

```
am> update AmsterModule --global --body body
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "defaults" : {
      "properties" : {
        "enabled" : {
          "title" : "Enabled",
          "description" : "If not enabled, prevents PKI login using the Amster module.",
          "propertyOrder" : 200,
          "required" : true,
          "type" : "boolean",
          "exampleValue" : ""
        },
        "authenticationLevel" : {
          "title" : "Authentication Level",
          "description" : "",
          "propertyOrder" : 300,
          "required" : true,
          "type" : "integer",
          "exampleValue" : ""
        },
        "authorizedKeys" : {
          "title" : "Authorized Keys",
          "description" : "The location of the authorized_keys file (which has the same format as an
 OpenSSH authorized_keys file) to use to validate remote Amster connections.",
          "propertyOrder" : 100,
          "required" : true,
          "type" : "string",
          "exampleValue" : ""
        }
      },
      "type" : "object",
      "title" : "Realm Defaults"
    }
  }
}
```

AnonymousModule

Realm Operations

Resource path: `/realm-config/authentication/modules/anonymous`

Resource version: `1.0`

create

Usage:

```
am> create AnonymousModule --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "defaultAnonymousUsername" : {
      "title" : "Default Anonymous User Name",
      "description" : "The default username to use if no username is supplied during authentication.",
      "propertyOrder" : 200,
      "required" : true,
      "type" : "string",
      "exampleValue" : ""
    },
    "caseSensitiveUsernameMatchingEnabled" : {
      "title" : "Case Sensitive User IDs",
      "description" : "If enabled, username matching will be case sensitive.",
      "propertyOrder" : 300,
      "required" : true,
      "type" : "boolean",
      "exampleValue" : ""
    },
    "validAnonymousUsers" : {
      "title" : "Valid Anonymous Users",
      "description" : "List of accounts that are allowed to login without providing
 credentials.<br><br>Any username on this list will be allows anonymous access to OpenAM. Usernames
 listed here must have matching profiles in the data store or the user profile requirement must be
 disabled. The username can be specified during anonymous authentication as follows:<br/><br/><code>/
openam/UI/Login?module=anonymous&IDToken1=<i>username</i></code>",
      "propertyOrder" : 100,
      "required" : true,
      "items" : {
        "type" : "string"
      },
      "type" : "array",
      "exampleValue" : ""
    },
    "authenticationLevel" : {
      "title" : "Authentication Level",
      "description" : "The authentication level associated with this module.<br><br>Each
 authentication module has an authentication level that can be used to indicate the level of security
 associated with the module; 0 is the lowest (and the default).",
      "propertyOrder" : 400,
      "required" : true,
      "type" : "integer",
      "exampleValue" : ""
```

```
    }
  }
}
```

delete

Usage:

```
am> delete AnonymousModule --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action AnonymousModule --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action AnonymousModule --realm Realm --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action AnonymousModule --realm Realm --actionName nextdescendents
```

query

Get the full list of instances of this collection. This query only supports `_queryFilter=true` filter.

Usage:

```
am> query AnonymousModule --realm Realm --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read AnonymousModule --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update AnonymousModule --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "defaultAnonymousUsername" : {
      "title" : "Default Anonymous User Name",
      "description" : "The default username to use if no username is supplied during authentication.",
      "propertyOrder" : 200,
      "required" : true,
      "type" : "string",
      "exampleValue" : ""
    },
    "caseSensitiveUsernameMatchingEnabled" : {
```

```
      "title" : "Case Sensitive User IDs",
      "description" : "If enabled, username matching will be case sensitive.",
      "propertyOrder" : 300,
      "required" : true,
      "type" : "boolean",
      "exampleValue" : ""
    },
    "validAnonymousUsers" : {
      "title" : "Valid Anonymous Users",
      "description" : "List of accounts that are allowed to login without providing
 credentials.<br><br>Any username on this list will be allows anonymous access to OpenAM. Usernames
 listed here must have matching profiles in the data store or the user profile requirement must be
 disabled. The username can be specified during anonymous authentication as follows:<br/><br/><code>/
openam/UI/Login?module=anonymous&IDToken1=<i>username</i></code>",
      "propertyOrder" : 100,
      "required" : true,
      "items" : {
        "type" : "string"
      },
      "type" : "array",
      "exampleValue" : ""
    },
    "authenticationLevel" : {
      "title" : "Authentication Level",
      "description" : "The authentication level associated with this module.<br><br>Each
 authentication module has an authentication level that can be used to indicate the level of security
 associated with the module; 0 is the lowest (and the default).",
      "propertyOrder" : 400,
      "required" : true,
      "type" : "integer",
      "exampleValue" : ""
    }
  }
}
```

Global Operations

Resource path: `/global-config/authentication/modules/anonymous`

Resource version: `1.0`

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action AnonymousModule --global --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action AnonymousModule --global --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action AnonymousModule --global --actionName nextdescendents
```

read

Usage:

```
am> read AnonymousModule --global
```

update

Usage:

```
am> update AnonymousModule --global --body body
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "defaults" : {
      "properties" : {
        "validAnonymousUsers" : {
          "title" : "Valid Anonymous Users",
          "description" : "List of accounts that are allowed to login without providing
 credentials.<br><br>Any username on this list will be allows anonymous access to OpenAM. Usernames
 listed here must have matching profiles in the data store or the user profile requirement must be
 disabled. The username can be specified during anonymous authentication as follows:<br/><br/><code>/

          "exampleValue" : ""
        },
        "caseSensitiveUsernameMatchingEnabled" : {
          "title" : "Case Sensitive User IDs",
          "description" : "If enabled, username matching will be case sensitive.",
          "propertyOrder" : 300,
          "required" : true,
          "type" : "boolean",
          "exampleValue" : ""
        }
      },
      "type" : "object",
      "title" : "Realm Defaults"
    }
  }
}
```

AnonymousSessionUpgrade

Realm Operations

Resource path: `/realm-config/authentication/authenticationtrees/nodes/AnonymousSessionUpgradeNode`

Resource version: `1.0`

create

Usage:

```
am> create AnonymousSessionUpgrade --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "required" : [ ]
}
```

delete

Usage:

```
am> delete AnonymousSessionUpgrade --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action AnonymousSessionUpgrade --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action AnonymousSessionUpgrade --realm Realm --actionName getCreatableTypes
```

listOutcomes

List the available outcomes for the node type.

Usage:

```
am> action AnonymousSessionUpgrade --realm Realm --body body --actionName listOutcomes
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "title" : "Some configuration of the node. This does not need to be complete against the
 configuration schema."
}
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action AnonymousSessionUpgrade --realm Realm --actionName nextdescendents
```

query

Get the full list of instances of this collection. This query only supports `_queryFilter=true` filter.

Usage:

```
am> query AnonymousSessionUpgrade --realm Realm --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read AnonymousSessionUpgrade --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update AnonymousSessionUpgrade --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "required" : [ ]
}
```

AnonymousUserMapping

Realm Operations

Resource path: `/realm-config/authentication/authenticationtrees/nodes/AnonymousUserNode`

Resource version: `1.0`

create

Usage:

```
am> create AnonymousUserMapping --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "anonymousUserName" : {
      "title" : "Anonymous User Name",
      "description" : "The username of the user that will represent the anonymous user. This user
 account must already exist in the realm.",
      "propertyOrder" : 100,
      "type" : "string",
      "exampleValue" : ""
    }
  },
  "required" : [ "anonymousUserName" ]
}
```

delete

Usage:

```
am> delete AnonymousUserMapping --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action AnonymousUserMapping --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action AnonymousUserMapping --realm Realm --actionName getCreatableTypes
```

listOutcomes

List the available outcomes for the node type.

Usage:

```
am> action AnonymousUserMapping --realm Realm --body body --actionName listOutcomes
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "title" : "Some configuration of the node. This does not need to be complete against the
 configuration schema."
}
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action AnonymousUserMapping --realm Realm --actionName nextdescendents
```

query

Get the full list of instances of this collection. This query only supports `_queryFilter=true` filter.

Usage:

```
am> query AnonymousUserMapping --realm Realm --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read AnonymousUserMapping --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update AnonymousUserMapping --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "anonymousUserName" : {
      "title" : "Anonymous User Name",
      "description" : "The username of the user that will represent the anonymous user. This user
 account must already exist in the realm.",
      "propertyOrder" : 100,
      "type" : "string",
      "exampleValue" : ""
    }
  },
  "required" : [ "anonymousUserName" ]
}
```

ApplicationTypes

Realm Operations

Service for reading and listing the available application types. Application types act as templates for policy sets, and define how to compare resources and index policies. OpenAM provides a default application type that represents web resources called iPlanetAMWebAgentService

Resource path: `/applicationtypes`

Resource version: `1.0`

query

Lists the application types using a query filter

Usage:

```
am> query ApplicationTypes --realm Realm --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all. Fields that can be queried: [*]

read

Reads an individual application type by the provided application type name

Usage:

```
am> read ApplicationTypes --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

Applications

Realm Operations

Service for manipulating Applications. It supports the CRUDQ operations.

Resource path: `/applications`

Resource version: `2.1`

create

Creates a new Application in a realm

Usage:

```
am> create Applications --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "$schema" : "http://json-schema.org/draft-04/schema#",
  "description" : "Application schema",
  "type" : "object",
  "title" : "Application",
  "properties" : {
    "name" : {
      "type" : "string",
      "title" : "Name",
      "description" : "Unique application identifier."
    },
    "displayName" : {
      "type" : "string",
      "title" : "Display name",
      "description" : "When defined, it is displayed in the UI instead of application name."
    },
    "description" : {
      "type" : "string",
      "title" : "Description",
      "description" : "String describing the application."
    },
    "applicationType" : {
      "type" : "string",
      "title" : "Application type",
      "description" : "Name of the application type used as a template for the policy set."
    },
    "conditions" : {
      "type" : "array",
      "items" : {
        "type" : "string",
        "title" : "Conditions",
        "description" : "Condition types allowed in the context of the policy set."
      }
    },
    "subjects" : {
      "type" : "array",
      "items" : {
        "type" : "string",

      }
    },
    "resourceTypeUuids" : {
      "type" : "array",
      "items" : {
        "type" : "string",
        "title" : "Resource type uuids",
        "description" : "A list of the UUIDs of the resource types associated with the policy set."
      }
    },
    "entitlementCombiner" : {
      "type" : "string",
      "title" : "Entitlement combiner",
      "description" : "Name of the decision combiner, such as \"DenyOverride\"."
    },
```

```
    "searchIndex" : {
      "type" : "string",
      "title" : "Search index",
      "description" : "Class name of the implementation for searching indexes for resource names, such
 as \"com.sun.identity.entitlement.util.ResourceNameSplitter\" for URL resource names."
    },
    "saveIndex" : {
      "type" : "string",
      "title" : "Save index",
      "description" : "Class name of the implementation for creating indexes for resource names, such
 as \"com.sun.identity.entitlement.util.ResourceNameIndexGenerator\" for URL resource names."
    },
    "resourceComparator" : {
      "type" : "string",
      "title" : "Resource comparator",
      "description" : "Class name of the resource comparator implementation
 used in the context of the policy set. The following implementations
 are available: \"com.sun.identity.entitlement.ExactMatchResourceName\",
 \"com.sun.identity.entitlement.PrefixResourceName\", \"com.sun.identity.entitlement.RegExResourceName
\", \"com.sun.identity.entitlement.URLResourceName\"."
    },
    "attributeNames" : {
      "type" : "array",
      "items" : {
        "type" : "string",
        "title" : "Attribute names",
        "description" : "A list of attribute names such as cn. The list is used to aid policy indexing
 and lookup."
      }
    },
    "createdBy" : {
      "type" : "string",
      "title" : "Created by",
      "description" : "A string containing the universal identifier DN of the subject that created the
 application."
    },
    "lastModifiedBy" : {
      "type" : "string",
      "title" : "Last modified by",
      "description" : "A string containing the universal identifier DN of the subject that most
 recently updated the application. If the application has not been modified since it was created, this
 will be the same value as createdBy."
    },
    "creationDate" : {
      "type" : "integer",
      "title" : "Creation date",
      "description" : "An integer containing the creation date and time, in number of seconds since
 the Unix Epoch."
    },
    "lastModifiedDate" : {
      "type" : "integer",
      "title" : "Last modified date",
      "description" : "An integer containing the last modified date and time, in number of seconds
 since the Unix Epoch. If the application has not been modified since it was created, this will be the
 same value as creationDate."
    },
    "editable" : {
      "type" : "boolean",
      "title" : "Editable",
```

```
      "description" : "It indicates if application is editable."
    }
  },
  "required" : [ "name", "applicationType" ]
}
```

delete

Deletes an individual Application in a realm specified by its name

Usage:

```
am> delete Applications --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

query

Lists all the Applications in a realm

Usage:

```
am> query Applications --realm Realm --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all. Fields that can be queried: [*]

read

Reads an individual Application in a realm specified by its name

Usage:

```
am> read Applications --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Updates an individual Application in a realm specified by its name

Usage:

```
am> update Applications --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "$schema" : "http://json-schema.org/draft-04/schema#",
  "description" : "Application schema",
  "type" : "object",
  "title" : "Application",
  "properties" : {
    "name" : {
      "type" : "string",
      "title" : "Name",
      "description" : "Unique application identifier."
    },
    "displayName" : {
      "type" : "string",
      "title" : "Display name",
      "description" : "When defined, it is displayed in the UI instead of application name."
    },
    "description" : {
      "type" : "string",
      "title" : "Description",
      "description" : "String describing the application."
    },
    "applicationType" : {
      "type" : "string",
      "title" : "Application type",
      "description" : "Name of the application type used as a template for the policy set."
    },
    "conditions" : {
      "type" : "array",

}
```

AttributeCollector

Realm Operations

Resource path: `/realm-config/authentication/authenticationtrees/nodes/AttributeCollectorNode`

Resource version: `1.0`

create

Usage:

```
am> create AttributeCollector --realm Realm --id id --body body
```

Parameters:

`--id`

The unique identifier for the resource.

`--body`

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "identityAttribute" : {
      "title" : "Identity Attribute",
      "description" : "The attribute used to identify the the object in IDM.",
      "propertyOrder" : 400,
      "type" : "string",
      "exampleValue" : ""
    },
```

```
    "required" : {
      "title" : "All Attributes Required",
      "description" : "When set, requires all attributes collected to contain non-null values.",
      "propertyOrder" : 200,
      "type" : "boolean",
      "exampleValue" : ""
    },
    "validateInputs" : {
      "title" : "Validate Input",
      "description" : "Set to true if client input should be validated against IDM policy as declared
 in the schema.",
      "propertyOrder" : 300,
      "type" : "boolean",
      "exampleValue" : ""
    },
    "attributesToCollect" : {
      "title" : "Attributes to Collect",
      "description" : "A set of attributes to collect from the client.",
      "propertyOrder" : 100,
      "items" : {
        "type" : "string"
      },
      "minItems" : 1,
      "type" : "array",
      "exampleValue" : ""
    }
  },
  "required" : [ "attributesToCollect", "validateInputs", "identityAttribute", "required" ]
}
```

delete

Usage:

```
am> delete AttributeCollector --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action AttributeCollector --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action AttributeCollector --realm Realm --actionName getCreatableTypes
```

listOutcomes

List the available outcomes for the node type.

Usage:

```
am> action AttributeCollector --realm Realm --body body --actionName listOutcomes
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "title" : "Some configuration of the node. This does not need to be complete against the
 configuration schema."
}
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action AttributeCollector --realm Realm --actionName nextdescendents
```

query

Get the full list of instances of this collection. This query only supports `_queryFilter=true` filter.

Usage:

```
am> query AttributeCollector --realm Realm --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read AttributeCollector --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update AttributeCollector --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "identityAttribute" : {
      "title" : "Identity Attribute",
      "description" : "The attribute used to identify the the object in IDM.",
      "propertyOrder" : 400,
      "type" : "string",
      "exampleValue" : ""
    },
    "required" : {
      "title" : "All Attributes Required",
      "description" : "When set, requires all attributes collected to contain non-null values.",
      "propertyOrder" : 200,
      "type" : "boolean",
      "exampleValue" : ""
    },
    "validateInputs" : {
      "title" : "Validate Input",
      "description" : "Set to true if client input should be validated against IDM policy as declared
 in the schema.",
      "propertyOrder" : 300,
      "type" : "boolean",
      "exampleValue" : ""
    },
    "attributesToCollect" : {
      "title" : "Attributes to Collect",
      "description" : "A set of attributes to collect from the client.",
      "propertyOrder" : 100,
      "items" : {
        "type" : "string"
      },
      "minItems" : 1,
      "type" : "array",
```

```
      "exampleValue" : ""
    }
  },
  "required" : [ "attributesToCollect", "validateInputs", "identityAttribute", "required" ]
}
```

AttributePresentDecision

Realm Operations

Resource path: `/realm-config/authentication/authenticationtrees/nodes/AttributePresentDecisionNode`

Resource version: `1.0`

create

Usage:

```
am> create AttributePresentDecision --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "identityAttribute" : {
      "title" : "Identity Attribute",
      "description" : "The attribute to query in the IDM object.",
      "propertyOrder" : 200,
      "type" : "string",
      "exampleValue" : ""
    },
    "presentAttribute" : {
      "title" : "Present Attribute",
      "description" : "The object attribute to verify is present regardless of whether the field is
 private.",
      "propertyOrder" : 100,
      "type" : "string",
      "exampleValue" : ""
    }
  },
  "required" : [ "presentAttribute", "identityAttribute" ]
}
```

delete

Usage:

```
am> delete AttributePresentDecision --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action AttributePresentDecision --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action AttributePresentDecision --realm Realm --actionName getCreatableTypes
```

listOutcomes

List the available outcomes for the node type.

Usage:

```
am> action AttributePresentDecision --realm Realm --body body --actionName listOutcomes
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "title" : "Some configuration of the node. This does not need to be complete against the
 configuration schema."
}
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action AttributePresentDecision --realm Realm --actionName nextdescendents
```

query

Get the full list of instances of this collection. This query only supports `_queryFilter=true` filter.

Usage:

```
am> query AttributePresentDecision --realm Realm --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read AttributePresentDecision --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update AttributePresentDecision --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "identityAttribute" : {
      "title" : "Identity Attribute",
      "description" : "The attribute to query in the IDM object.",
      "propertyOrder" : 200,
      "type" : "string",
      "exampleValue" : ""
    },
    "presentAttribute" : {
      "title" : "Present Attribute",
      "description" : "The object attribute to verify is present regardless of whether the field is
 private.",
      "propertyOrder" : 100,
      "type" : "string",
      "exampleValue" : ""
    }
  },
  "required" : [ "presentAttribute", "identityAttribute" ]
}
```

AttributeValueDecision

Realm Operations

Resource path: `/realm-config/authentication/authenticationtrees/nodes/AttributeValueDecisionNode`

Resource version: `1.0`

create

Usage:

```
am> create AttributeValueDecision --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
```

```
    "identityAttribute" : {
      "title" : "Identity Attribute",
      "description" : "The attribute to query in the IDM object.",
      "propertyOrder" : 400,
      "type" : "string",
      "exampleValue" : ""
    },
    "comparisonValue" : {
      "title" : "Comparison Value",
      "description" : "If using the EQUALS comparison operation, the value to compare the object's
 attribute value to.",
      "propertyOrder" : 300,
      "type" : "string",
      "exampleValue" : ""
    },
    "comparisonOperation" : {
      "title" : "Comparison Operation",
      "description" : "The operation to perform on the object attribute; PRESENT checks for existence
 of an attribute, EQUALS checks if the object's attribute value equals the configured comparison
 value.",
      "propertyOrder" : 200,
      "type" : "string",
      "exampleValue" : ""
    },
    "comparisonAttribute" : {
      "title" : "Comparison Attribute",
      "description" : "The object attribute to compare.",
      "propertyOrder" : 100,
      "type" : "string",
      "exampleValue" : ""
    }
  },
  "required" : [ "identityAttribute", "comparisonOperation", "comparisonAttribute" ]
}
```

delete

Usage:

```
am> delete AttributeValueDecision --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action AttributeValueDecision --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action AttributeValueDecision --realm Realm --actionName getCreatableTypes
```

listOutcomes

List the available outcomes for the node type.

Usage:

```
am> action AttributeValueDecision --realm Realm --body body --actionName listOutcomes
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "title" : "Some configuration of the node. This does not need to be complete against the
 configuration schema."
}
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action AttributeValueDecision --realm Realm --actionName nextdescendents
```

query

Get the full list of instances of this collection. This query only supports `_queryFilter=true` filter.

Usage:

```
am> query AttributeValueDecision --realm Realm --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read AttributeValueDecision --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update AttributeValueDecision --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "identityAttribute" : {
      "title" : "Identity Attribute",
      "description" : "The attribute to query in the IDM object.",
      "propertyOrder" : 400,
      "type" : "string",
      "exampleValue" : ""
    },
    "comparisonValue" : {
      "title" : "Comparison Value",
      "description" : "If using the EQUALS comparison operation, the value to compare the object's
 attribute value to.",
      "propertyOrder" : 300,
      "type" : "string",
      "exampleValue" : ""
    },
    "comparisonOperation" : {
      "title" : "Comparison Operation",
      "description" : "The operation to perform on the object attribute; PRESENT checks for existence
 of an attribute, EQUALS checks if the object's attribute value equals the configured comparison
 value.",
      "propertyOrder" : 200,
      "type" : "string",
      "exampleValue" : ""
    },
    "comparisonAttribute" : {
      "title" : "Comparison Attribute",
      "description" : "The object attribute to compare.",
```

```
      "propertyOrder" : 100,
      "type" : "string",
      "exampleValue" : ""
    }
  },
  "required" : [ "identityAttribute", "comparisonOperation", "comparisonAttribute" ]
}
```

AuditEvent

Realm Operations

Audit events are logged through a realm audit service.

Resource path: `/realm-audit/{topic}`

Resource version: `1.0`

create

Create a new audit event, which will be handled and logged by the configured audit service.

Usage:

```
am> create AuditEvent --realm Realm --topic topic --body body
```

Parameters:

--topic

Audit events are logged through a realm audit service.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "$schema" : "http://json-schema.org/draft-04/schema#",
  "description" : "The schema contains properties that are common to all topics and some that are
 unique to a specific topic. The description of each property indicates which topic the property
 applies to.",
  "title" : "Audit event schema",
  "type" : "object",
  "properties" : {
    "_id" : {
      "title" : "ID",
      "description" : "The ID of the event, used by all topics",
      "type" : "string"
    },
    "timestamp" : {
      "title" : "Timestamp",
      "description" : "The time at which the event occurred, used by all topics",
      "type" : "string"
```

```
    },
    "eventName" : {
      "title" : "Event name",
      "description" : "The name of the event, used by all topics",

```

Global Operations

Audit events are logged through the global audit service.

Resource path: `/global-audit/{topic}`

Resource version: `1.0`

create

Create a new audit event, which will be handled and logged by the configured audit service.

Usage:

```
am> create AuditEvent --global --topic topic --body body
```

Parameters:

--topic

Audit events are logged through the global audit service.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "$schema" : "http://json-schema.org/draft-04/schema#",
  "description" : "The schema contains properties that are common to all topics and some that are
 unique to a specific topic. The description of each property indicates which topic the property
 applies to.",
  "title" : "Audit event schema",
  "type" : "object",
  "properties" : {
    "_id" : {
      "title" : "ID",

AuditLogging

Realm Operations

Resource path: `/realm-config/services/audit`

Resource version: `1.0`

create

Usage:

```
am> create AuditLogging --realm Realm --body body
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "blacklistFieldFilters" : {
      "title" : "Field blacklist filters",
      "description" : "Blacklist filters can be used to remove audit event fields which are
 whitelisted by default. These are fields which are safe to log but which you have decided are not
 necessary for your requirements. <p> Each field filter should be provided using a JSON Pointer-
like syntax which is prefixed with the event's topic. The topic will be one of <code>access</code>,
 <code>activity</code>, <code>authentication</code>, or <code>config</code>.<p> For example, you might
 want to filter out surnames by hiding the <code>sn</code> field from <em>activity</em> events. To do
 so, add the following pointers to the Field blacklist filters list: <ul><li><code>/activity/before/
sn</code></li><li><code>/activity/after/sn</code></li></ul>",
      "propertyOrder" : 300,
      "required" : false,
      "items" : {
        "type" : "string"
      },
      "type" : "array",
      "exampleValue" : ""
    },
    "auditEnabled" : {
      "title" : "Audit logging",
      "description" : "Enable audit logging in OpenAM.",
      "propertyOrder" : 100,
      "required" : true,
      "type" : "boolean",
      "exampleValue" : ""
    },
    "whitelistFieldFilters" : {
      "title" : "Field whitelist filters",
      "description" : "OpenAM has a predefined whitelist built-in that only records values that
 do not contain sensitive information. Use this property to whitelist fields in addition to the
 built-in list. <p> Each field filter should be provided using a JSON Pointer-like syntax which is
 prefixed with the event's topic. The topic will be one of <code>access</code>, <code>activity</code>,
 <code>authentication</code>, or <code>config</code>.<p> For example, to record the values of the
 <code>Accept-Language</code> HTTP header in <em>access</em> events, the pointer is <code>/access/
http/request/headers/accept-language</code>.",
      "propertyOrder" : 200,
      "required" : false,
      "items" : {
        "type" : "string"
      },
      "type" : "array",
      "exampleValue" : ""
    }
  }
}
```

delete

Usage:

```
am> delete AuditLogging --realm Realm
```

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action AuditLogging --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action AuditLogging --realm Realm --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action AuditLogging --realm Realm --actionName nextdescendents
```

read

Usage:

```
am> read AuditLogging --realm Realm
```

update

Usage:

```
am> update AuditLogging --realm Realm --body body
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "blacklistFieldFilters" : {
```

```
      "title" : "Field blacklist filters",
      "description" : "Blacklist filters can be used to remove audit event fields which are
 whitelisted by default. These are fields which are safe to log but which you have decided are not
 necessary for your requirements. <p> Each field filter should be provided using a JSON Pointer-
like syntax which is prefixed with the event's topic. The topic will be one of <code>access</code>,
 <code>activity</code>, <code>authentication</code>, or <code>config</code>.<p> For example, you might
 want to filter out surnames by hiding the <code>sn</code> field from <em>activity</em> events. To do
 so, add the following pointers to the Field blacklist filters list: <ul><li><code>/activity/before/
sn</code></li><li><code>/activity/after/sn</code></li></ul>",

Global Operations

Resource path: `/global-config/services/audit`

Resource version: `1.0`

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action AuditLogging --global --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action AuditLogging --global --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action AuditLogging --global --actionName nextdescendents
```

read

Usage:

```
am> read AuditLogging --global
```

update

Usage:

```
am> update AuditLogging --global --body body
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "auditEnabled" : {
      "title" : "Audit logging",
      "description" : "Enable audit logging in OpenAM.",

```

AuthLevelDecision

Realm Operations

Resource path: `/realm-config/authentication/authenticationtrees/nodes/AuthLevelDecisionNode`

Resource version: `1.0`

create

Usage:

```
am> create AuthLevelDecision --realm Realm --id id --body body
```

Parameters:

`--id`

The unique identifier for the resource.

`--body`

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "authLevelRequirement" : {
      "title" : "Sufficient Authentication Level",
      "description" : "The current authentication level must be greater than or equal to this value
 for the decision to return true.",
      "propertyOrder" : 100,
      "type" : "integer",
      "exampleValue" : ""
    }
  },
  "required" : [ "authLevelRequirement" ]
}
```

delete

Usage:

```
am> delete AuthLevelDecision --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action AuthLevelDecision --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action AuthLevelDecision --realm Realm --actionName getCreatableTypes
```

listOutcomes

List the available outcomes for the node type.

Usage:

```
am> action AuthLevelDecision --realm Realm --body body --actionName listOutcomes
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "title" : "Some configuration of the node. This does not need to be complete against the
 configuration schema."
}
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action AuthLevelDecision --realm Realm --actionName nextdescendents
```

query

Get the full list of instances of this collection. This query only supports `_queryFilter=true` filter.

Usage:

```
am> query AuthLevelDecision --realm Realm --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read AuthLevelDecision --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update AuthLevelDecision --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "authLevelRequirement" : {
      "title" : "Sufficient Authentication Level",
      "description" : "The current authentication level must be greater than or equal to this value
 for the decision to return true.",
      "propertyOrder" : 100,
      "type" : "integer",
      "exampleValue" : ""
    }
  },
  "required" : [ "authLevelRequirement" ]
}
```

AuthTree

Realm Operations

Authentication trees.

Resource path: `/realm-config/authentication/authenticationtrees/trees`

Resource version: `1.0`

clone

Creates a new tree and underlying set of nodes with the same node configurations as the cloned tree.

Usage:

```
am> action AuthTree --realm Realm --body body --actionName clone
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "newId" : {
      "type" : "string",
      "title" : "New Tree ID",
      "description" : "The ID for the tree that will be created."
    }
  }
}
```

create

Usage:

```
am> create AuthTree --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "description" : "A tree contains a set of nodes and their connections.",
  "type" : "object",
  "title" : "Authentication Tree",
  "properties" : {

      "title" : "Identity Resource",
      "description" : "Optional IDM identity resource, e.g. managed/user."
    }
  }
}
```

delete

Usage:

```
am> delete AuthTree --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action AuthTree --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action AuthTree --realm Realm --actionName getCreatableTypes
```

getIds

Get the names of each tree configured in this realm.

Usage:

```
am> action AuthTree --realm Realm --actionName getIds
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action AuthTree --realm Realm --actionName nextdescendents
```

query

Query for all authentication trees. Only a query filter of 'true' is supported.

Usage:

```
am> query AuthTree --realm Realm --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read AuthTree --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update AuthTree --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "description" : "A tree contains a set of nodes and their connections.",
  "type" : "object",
  "title" : "Authentication Tree",
  "properties" : {
    "description" : {
      "type" : "string",
      "title" : "Description",
      "description" : "A description of the tree."
    },
    "nodes" : {
      "type" : "object",
      "title" : "Nodes",
      "description" : "A map of node ID to node association details.",

        }
      }
    },
```

```
    "identityResource" : {
      "type" : "string",
      "title" : "Identity Resource",
      "description" : "Optional IDM identity resource, e.g. managed/user."
    }
  }
}
```

validate

Validates a tree giving errors and warnings.

Usage:

```
am> action AuthTree --realm Realm --body body --actionName validate
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "description" : "A tree contains a set of nodes and their connections.",
  "type" : "object",
  "title" : "Authentication Tree",
  "properties" : {
    "description" : {
      "type" : "string",
      "title" : "Description",
      "description" : "A description of the tree."
    },
    "nodes" : {
      "type" : "object",
      "title" : "Nodes",
      "description" : "A map of node ID to node association details.",

  }
}
```

AuthenticateThing

Realm Operations

Resource path: `/realm-config/authentication/authenticationtrees/nodes/IotAuthenticationNode`

Resource version: `1.0`

create

Usage:

```
am> create AuthenticateThing --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "required" : [ ]
}
```

delete

Usage:

```
am> delete AuthenticateThing --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action AuthenticateThing --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action AuthenticateThing --realm Realm --actionName getCreatableTypes
```

listOutcomes

List the available outcomes for the node type.

Usage:

```
am> action AuthenticateThing --realm Realm --body body --actionName listOutcomes
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "title" : "Some configuration of the node. This does not need to be complete against the
 configuration schema."
}
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action AuthenticateThing --realm Realm --actionName nextdescendents
```

query

Get the full list of instances of this collection. This query only supports `_queryFilter=true` filter.

Usage:

```
am> query AuthenticateThing --realm Realm --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read AuthenticateThing --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update AuthenticateThing --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "required" : [ ]
}
```

Authentication

Realm Operations

Resource path: `/realm-config/authentication`

Resource version: `1.0`

create

Usage:

```
am> create Authentication --realm Realm --body body
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "accountlockout" : {
      "type" : "object",
      "title" : "Account Lockout",
      "propertyOrder" : 2,
      "properties" : {
        "lockoutDuration" : {
          "title" : "Login Failure Lockout Duration",
          "description" : "The duration of the users account lockout, in minutes.<br><br>OpenAM can
 either lockout the users account indefinitely (until administration action) by setting the duration
 to 0, (the default) or OpenAM can lock the users account for a given number of minutes. After the
 lockout interval, the user will be able to successfully authenticate to OpenAM.",

AuthenticationChains

Realm Operations

Resource path: `/realm-config/authentication/chains`

Resource version: `1.0`

create

Usage:

```
am> create AuthenticationChains --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "loginPostProcessClass" : {
      "title" : "Authentication Post Processing Classes",
      "description" : "Example: com.abc.authentication.PostProcessClass",
      "propertyOrder" : 400,
      "required" : true,
      "items" : {
        "type" : "string"
      },
      "type" : "array",
      "exampleValue" : ""
    },
    "authChainConfiguration" : {
      "title" : "Authentication Configuration",
      "description" : "",
      "propertyOrder" : 100,
      "required" : true,
      "exampleValue" : "",
      "type" : "array",
      "items" : {
        "type" : "object",
        "properties" : {
          "module" : {
            "type" : "string"
          },
          "criteria" : {
            "type" : "string"
```

```
          },
          "options" : {
            "type" : "object",
            "patternProperties" : {
              ".*" : {
                "type" : "string"
              }
            }
          }
        }
      }
    },
    "loginFailureUrl" : {
      "title" : "Login Failed URL",
      "description" : "URL or ClientType|URL if client specific. URL without http(s) protocol will be
 appended to the current URI.",
      "propertyOrder" : 300,
      "required" : true,
      "items" : {
        "type" : "string"
      },
      "type" : "array",
      "exampleValue" : ""
    },
    "loginSuccessUrl" : {
      "title" : "Login Success URL",
      "description" : "URL or ClientType|URL if client specific. URL without http(s) protocol will be
 appended to the current URI.",
      "propertyOrder" : 200,
      "required" : true,
      "items" : {
        "type" : "string"
      },
      "type" : "array",
      "exampleValue" : ""
    }
  }
}
```

delete

Usage:

```
am> delete AuthenticationChains --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action AuthenticationChains --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action AuthenticationChains --realm Realm --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action AuthenticationChains --realm Realm --actionName nextdescendents
```

query

Get the full list of instances of this collection. This query only supports `_queryFilter=true` filter.

Usage:

```
am> query AuthenticationChains --realm Realm --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read AuthenticationChains --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update AuthenticationChains --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "loginPostProcessClass" : {
      "title" : "Authentication Post Processing Classes",
      "description" : "Example: com.abc.authentication.PostProcessClass",
      "propertyOrder" : 400,
      "required" : true,
      "items" : {
        "type" : "string"
      },
      "type" : "array",
      "exampleValue" : ""
    },
    "authChainConfiguration" : {
      "title" : "Authentication Configuration",
      "description" : "",
      "propertyOrder" : 100,
      "required" : true,
      "exampleValue" : "",
      "type" : "array",
      "items" : {
        "type" : "object",
        "properties" : {
          "module" : {
            "type" : "string"
          },
          "criteria" : {
            "type" : "string"
          },
          "options" : {
            "type" : "object",
            "patternProperties" : {
              ".*" : {
                "type" : "string"
              }
            }
          }
        }
      }
    },
    "loginFailureUrl" : {
      "title" : "Login Failed URL",
```

```
      "description" : "URL or ClientType|URL if client specific. URL without http(s) protocol will be
 appended to the current URI.",
      "propertyOrder" : 300,
      "required" : true,
      "items" : {
        "type" : "string"
      },
      "type" : "array",
      "exampleValue" : ""
    },
    "loginSuccessUrl" : {
      "title" : "Login Success URL",
      "description" : "URL or ClientType|URL if client specific. URL without http(s) protocol will be
 appended to the current URI.",
      "propertyOrder" : 200,
      "required" : true,
      "items" : {
        "type" : "string"
      },
      "type" : "array",
      "exampleValue" : ""
    }
  }
}
```

Global Operations

Resource path: `/global-config/authentication/chains`

Resource version: `1.0`

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action AuthenticationChains --global --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action AuthenticationChains --global --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action AuthenticationChains --global --actionName nextdescendents
```

read

Usage:

```
am> read AuthenticationChains --global
```

update

Usage:

```
am> update AuthenticationChains --global --body body
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "dynamic" : {
      "properties" : {
        "authChainConfiguration" : {
          "title" : "Authentication Configuration",
          "description" : "",
          "propertyOrder" : 100,
          "required" : true,
          "type" : "string",
          "exampleValue" : ""
        }
      },
      "type" : "object",
      "title" : "Dynamic Attributes"
    }
  }
}
```

AuthenticationModules

Realm Operations

The collection of all authentication modules in a realm allows querying for all module instances.

Resource path: `/realm-config/authentication/modules`

Resource version: `1.0`

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action AuthenticationModules --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action AuthenticationModules --realm Realm --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action AuthenticationModules --realm Realm --actionName nextdescendents
```

query

Query for authentication module instances

Usage:

```
am> query AuthenticationModules --realm Realm --filter filter
```

Parameters:

`--filter`

A CREST formatted query filter, where "true" will query all. Fields that can be queried: [_id]

Global Operations

Global and default configuration for authentication modules

Resource path: `/global-config/authentication/modules`

Resource version: `1.0`

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action AuthenticationModules --global --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action AuthenticationModules --global --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action AuthenticationModules --global --actionName nextdescendents
```

AuthenticationNodes

Realm Operations

Auth Tree Nodes

Resource path: `/realm-config/authentication/authenticationtrees/nodes`

Resource version: `1.0`

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action AuthenticationNodes --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action AuthenticationNodes --realm Realm --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action AuthenticationNodes --realm Realm --actionName nextdescendents
```

AuthenticationTreesConfiguration

Realm Operations

Sub-path parent for all authentication tree configuration.

Resource path: `/realm-config/authentication/authenticationtrees`

Resource version: `1.0`

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action AuthenticationTreesConfiguration --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action AuthenticationTreesConfiguration --realm Realm --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action AuthenticationTreesConfiguration --realm Realm --actionName nextdescendents
```

Global Operations

Resource path: `/global-config/authentication/authenticationtrees`

Resource version: `1.0`

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action AuthenticationTreesConfiguration --global --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action AuthenticationTreesConfiguration --global --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action AuthenticationTreesConfiguration --global --actionName nextdescendents
```

read

Usage:

```
am> read AuthenticationTreesConfiguration --global
```

update

Usage:

```
am> update AuthenticationTreesConfiguration --global --body body
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object"
}
```

AuthenticatorOath

Realm Operations

Resource path: `/realm-config/services/authenticatorOathService`

Resource version: `1.0`

create

Usage:

```
am> create AuthenticatorOath --realm Realm --body body
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "authenticatorOATHDeviceSettingsEncryptionKeystorePrivateKeyPassword" : {
      "title" : "Private Key Password",

      "propertyOrder" : 600,
      "required" : true,
      "type" : "string",
      "exampleValue" : ""
    }
  }
}
```

delete

Usage:

```
am> delete AuthenticatorOath --realm Realm
```

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action AuthenticatorOath --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action AuthenticatorOath --realm Realm --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action AuthenticatorOath --realm Realm --actionName nextdescendents
```

read

Usage:

```
am> read AuthenticatorOath --realm Realm
```

update

Usage:

```
am> update AuthenticatorOath --realm Realm --body body
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {

    }
  }
}
```

Global Operations

Resource path: `/global-config/services/authenticatorOathService`

Resource version: `1.0`

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action AuthenticatorOath --global --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action AuthenticatorOath --global --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action AuthenticatorOath --global --actionName nextdescendents
```

read

Usage:

```
am> read AuthenticatorOath --global
```

update

Usage:

```
am> update AuthenticatorOath --global --body body
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{

AuthenticatorOathModule

Realm Operations

Resource path: `/realm-config/authentication/modules/authenticatoroath`

Resource version: `1.0`

create

Usage:

```
am> create AuthenticatorOathModule --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "minimumSecretKeyLength" : {
      "title" : "Minimum Secret Key Length",
      "description" : "Number of hexadecimal characters allowed for the Secret Key.",
      "propertyOrder" : 300,
      "required" : true,
      "type" : "integer",
      "exampleValue" : ""
    },
    "addChecksumToOtpEnabled" : {
      "title" : "Add Checksum Digit",
      "description" : "This adds a checksum digit to the OTP.<br><br>This adds a digit to the end
 of the OTP generated to be used as a checksum to verify the OTP was generated correctly. This is in
 addition to the actual password length. You should only set this if your device supports it.",
      "propertyOrder" : 600,
      "required" : true,
      "type" : "string",
      "exampleValue" : ""
    },
    "oathAlgorithm" : {
      "title" : "OATH Algorithm to Use",
      "description" : "Choose the algorithm your device uses to generate the OTP.<br><br>HOTP uses a
 counter value that is incremented every time a new OTP is generated. TOTP generates a new OTP every
 few seconds as specified by the time step interval.",
      "propertyOrder" : 400,
      "required" : true,
      "type" : "string",
```

```
      "exampleValue" : ""
    },
    "oathIssuerName" : {
      "title" : "Name of the Issuer",

 is the number of time step intervals to check the received OTP against both forward in time and back
 in time. For example, with 1 time steps and a time step interval of 30 seconds the server will allow
 a code between the previous code, the current code and the next code.",
      "propertyOrder" : 900,
      "required" : true,
      "type" : "integer",
      "exampleValue" : ""
    }
  }
}
```

delete

Usage:

```
am> delete AuthenticatorOathModule --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action AuthenticatorOathModule --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action AuthenticatorOathModule --realm Realm --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action AuthenticatorOathModule --realm Realm --actionName nextdescendents
```

query

Get the full list of instances of this collection. This query only supports `_queryFilter=true` filter.

Usage:

```
am> query AuthenticatorOathModule --realm Realm --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read AuthenticatorOathModule --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update AuthenticatorOathModule --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{

Global Operations

Resource path: `/global-config/authentication/modules/authenticatoroath`

Resource version: `1.0`

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action AuthenticatorOathModule --global --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action AuthenticatorOathModule --global --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action AuthenticatorOathModule --global --actionName nextdescendents
```

read

Usage:

```
am> read AuthenticatorOathModule --global
```

update

Usage:

```
am> update AuthenticatorOathModule --global --body body
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```

AuthenticatorPush

Realm Operations

Resource path: `/realm-config/services/authenticatorPushService`

Resource version: `1.0`

create

Usage:

```
am> create AuthenticatorPush --realm Realm --body body
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "authenticatorPushDeviceSettingsEncryptionKeystorePassword" : {
      "title" : "Key Store Password",
      "description" : "Password to unlock the key store. This password is encrypted when it is saved
 in the OpenAM configuration. You should modify the default value.",
      "propertyOrder" : 500,
      "required" : true,
      "type" : "string",
      "format" : "password",
      "exampleValue" : ""
    },
    "authenticatorPushDeviceSettingsEncryptionKeystorePrivateKeyPassword" : {
      "title" : "Private Key Password",
      "description" : "Password to unlock the private key.",
      "propertyOrder" : 700,
      "required" : true,
      "type" : "string",
      "format" : "password",
      "exampleValue" : ""
    },
    "authenticatorPushDeviceSettingsEncryptionScheme" : {
      "title" : "Device Profile Encryption Scheme",
      "description" : "Encryption scheme to use to secure device profiles stored on the
 server.<br><br>If enabled, each device profile is encrypted using a unique random secret key
 using the given strength of AES encryption in CBC mode with PKCS#5 padding. An HMAC-SHA of the
 given strength (truncated to half-size) is used to ensure integrity protection and authenticated
 encryption. The unique random key is encrypted with the given RSA key pair and stored with the device
 profile.<p><p><i>Note:</i> AES-256 may require installation of the JCE Unlimited Strength policy
 files.",

      "required" : true,
      "type" : "string",
      "exampleValue" : ""
    }
  }
}
```

delete

Usage:

```
am> delete AuthenticatorPush --realm Realm
```

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action AuthenticatorPush --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action AuthenticatorPush --realm Realm --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action AuthenticatorPush --realm Realm --actionName nextdescendents
```

read

Usage:

```
am> read AuthenticatorPush --realm Realm
```

update

Usage:

```
am> update AuthenticatorPush --realm Realm --body body
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "authenticatorPushDeviceSettingsEncryptionKeystorePassword" : {
      "title" : "Key Store Password",

AuthenticatorPushModule

Realm Operations

Resource path: `/realm-config/authentication/modules/authPush`

Resource version: `1.0`

create

Usage:

```
am> create AuthenticatorPushModule --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "timeoutInMilliSecconds" : {
      "title" : "Return Message Timeout (ms)",
      "description" : "The period of time (in milliseconds) within which a push notification should be
 replied to.",
      "propertyOrder" : 200,
      "required" : true,
      "type" : "integer",
      "exampleValue" : ""
    },
    "pushMessage" : {
      "title" : "Login Message",
      "description" : "Message transmitted over Push. Use the label {{user}} to replace with the
 registered login's username, and {{issuer}} to replace with the name of the issuer stored at
 registration.",
      "propertyOrder" : 300,
      "required" : true,
      "type" : "string",
      "exampleValue" : ""
    },
    "authenticationLevel" : {
      "title" : "Authentication Level",
      "description" : "The authentication level associated with this module.<br><br>Each
 authentication module has an authentication level that can be used to indicate the level of security
 associated with the module; 0 is the lowest (and the default).",
      "propertyOrder" : 100,
      "required" : true,
      "type" : "integer",
      "exampleValue" : ""
    }
  }
}
```

delete

Usage:

```
am> delete AuthenticatorPushModule --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action AuthenticatorPushModule --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action AuthenticatorPushModule --realm Realm --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action AuthenticatorPushModule --realm Realm --actionName nextdescendents
```

query

Get the full list of instances of this collection. This query only supports `_queryFilter=true` filter.

Usage:

```
am> query AuthenticatorPushModule --realm Realm --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read AuthenticatorPushModule --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update AuthenticatorPushModule --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "timeoutInMilliSecconds" : {
      "title" : "Return Message Timeout (ms)",
      "description" : "The period of time (in milliseconds) within which a push notification should be
 replied to.",
      "propertyOrder" : 200,
      "required" : true,
      "type" : "integer",
      "exampleValue" : ""
    },
    "pushMessage" : {
      "title" : "Login Message",
      "description" : "Message transmitted over Push. Use the label {{user}} to replace with the

    }
  }
}
```

Global Operations

Resource path: `/global-config/authentication/modules/authPush`

Resource version: `1.0`

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action AuthenticatorPushModule --global --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action AuthenticatorPushModule --global --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action AuthenticatorPushModule --global --actionName nextdescendents
```

read

Usage:

```
am> read AuthenticatorPushModule --global
```

update

Usage:

```
am> update AuthenticatorPushModule --global --body body
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "defaults" : {
      "properties" : {

  }
}
```

delete

Usage:

```
am> delete AuthenticatorPushRegistrationModule --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action AuthenticatorPushRegistrationModule --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action AuthenticatorPushRegistrationModule --realm Realm --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action AuthenticatorPushRegistrationModule --realm Realm --actionName nextdescendents
```

query

Get the full list of instances of this collection. This query only supports `_queryFilter=true` filter.

Usage:

```
am> query AuthenticatorPushRegistrationModule --realm Realm --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read AuthenticatorPushRegistrationModule --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update AuthenticatorPushRegistrationModule --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "appleLink" : {
      "title" : "App Store App URL",
      "description" : "URL of the app to download on the App Store.",
      "propertyOrder" : 600,
      "required" : true,
      "type" : "string",
      "exampleValue" : ""
    },
    "googleLink" : {
      "title" : "Google Play URL",
      "description" : "URL of the app to download on Google Play.",
      "propertyOrder" : 700,
      "required" : true,
      "type" : "string",
      "exampleValue" : ""
    },

      "exampleValue" : ""
    }
  }
}
```

Global Operations

Resource path: `/global-config/authentication/modules/authPushReg`

Resource version: `1.0`

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action AuthenticatorPushRegistrationModule --global --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action AuthenticatorPushRegistrationModule --global --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action AuthenticatorPushRegistrationModule --global --actionName nextdescendents
```

read

Usage:

```
am> read AuthenticatorPushRegistrationModule --global
```

update

Usage:

```
am> update AuthenticatorPushRegistrationModule --global --body body
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{

```

BaseUrlSource

Realm Operations

Resource path: `/realm-config/services/baseurl`

Resource version: `1.0`

create

Usage:

```
am> create BaseUrlSource --realm Realm --body body
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "source" : {
      "title" : "Base URL Source",
      "description" : "Specifies the source of the base URL. Choose from the
following:<ul> <li>Extension class. Specifies that the extension class returns a
base URL from a provided HttpServletRequest. In the Extension class name field, enter
<code>org.forgerock.openam.services.baseurl.BaseURLProvider</code>.</li><li>Fixed value. Specifies
that the base URL is retrieved from a specific base URL value. In the Fixed value base URL field,
enter the base URL value.</li><li>Forwarded header. Specifies that the base URL is retrieved from
a forwarded header field in the HTTP request. The Forwarded HTTP header field is standardized and
specified in <a href=\"https://tools.ietf.org/html/rfc7239\">RFC7239</a>.</li><li>Host/protocol
from incoming request. Specifies that the hostname, server name, and port are retrieved from the
incoming HTTP request.</li><li>X-Forwarded-* headers. Specifies that the base URL is retrieved from
non-standard header fields, such as <code>X-Forwarded-For</code>, <code>X-Forwarded-By</code>, and
<code>X-Forwarded-Proto</code>.</li></ul>",
      "propertyOrder" : 100,
      "required" : true,
      "type" : "string",
      "exampleValue" : ""
    },
```

```
    "contextPath" : {
      "title" : "Context path",
      "description" : "Specifies the context path for the base URL.<p><p>If provided, the base URL
 includes the deployment context path appended to the calculated URL.<p>For example, <code>/openam</
code>.",
      "propertyOrder" : 400,
      "required" : true,
      "type" : "string",
      "exampleValue" : ""
    },
    "fixedValue" : {
      "title" : "Fixed value base URL",
      "description" : "If Fixed value is selected as the Base URL source, enter the base URL in the
 Fixed value base URL field.",
      "propertyOrder" : 200,
      "required" : true,
      "type" : "string",
      "exampleValue" : ""
    },
    "extensionClassName" : {
      "title" : "Extension class name",
      "description" : "If Extension class is selected as the Base URL source, enter
 <code>org.forgerock.openam.services.baseurl.BaseURLProvider</code> in the Extension class name
 field.",
      "propertyOrder" : 300,
      "required" : true,
      "type" : "string",
      "exampleValue" : ""
    }
  }
}
```

delete

Usage:

```
am> delete BaseUrlSource --realm Realm
```

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action BaseUrlSource --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action BaseUrlSource --realm Realm --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action BaseUrlSource --realm Realm --actionName nextdescendents
```

read

Usage:

```
am> read BaseUrlSource --realm Realm
```

update

Usage:

```
am> update BaseUrlSource --realm Realm --body body
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "source" : {
      "title" : "Base URL Source",
      "description" : "Specifies the source of the base URL. Choose from the
 following:<ul> <li>Extension class. Specifies that the extension class returns a
 base URL from a provided HttpServletRequest. In the Extension class name field, enter
 <code>org.forgerock.openam.services.baseurl.BaseURLProvider</code>.</li><li>Fixed value. Specifies
 that the base URL is retrieved from a specific base URL value. In the Fixed value base URL field,
 enter the base URL value.</li><li>Forwarded header. Specifies that the base URL is retrieved from
 a forwarded header field in the HTTP request. The Forwarded HTTP header field is standardized and
 specified in <a href=\"https://tools.ietf.org/html/rfc7239\">RFC7239</a>.</li><li>Host/protocol
 from incoming request. Specifies that the hostname, server name, and port are retrieved from the
 incoming HTTP request.</li><li>X-Forwarded-* headers. Specifies that the base URL is retrieved from
 non-standard header fields, such as <code>X-Forwarded-For</code>, <code>X-Forwarded-By</code>, and
 <code>X-Forwarded-Proto</code>.</li></ul>",
      "propertyOrder" : 100,
      "required" : true,
      "type" : "string",
      "exampleValue" : ""
    },
```

```
    "contextPath" : {
      "title" : "Context path",
      "description" : "Specifies the context path for the base URL.<p><p>If provided, the base URL

      "required" : true,
      "type" : "string",
      "exampleValue" : ""
    }
  }
}
```

Global Operations

Resource path: `/global-config/services/baseurl`

Resource version: `1.0`

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action BaseUrlSource --global --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action BaseUrlSource --global --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action BaseUrlSource --global --actionName nextdescendents
```

read

Usage:

```
am> read BaseUrlSource --global
```

update

Usage:

```
am> update BaseUrlSource --global --body body
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "defaults" : {
      "properties" : {

      "title" : "Realm Defaults"
    }
  }
}
```

CORSService

Global Operations

Resource path: `/global-config/services/CorsService`

Resource version: `1.0`

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action CORSService --global --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action CORSService --global --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action CORSService --global --actionName nextdescendents
```

read

Usage:

```
am> read CORSService --global
```

update

Usage:

```
am> update CORSService --global --body body
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "enabled" : {
      "title" : "Enable the CORS filter",
      "description" : "If disable, no CORS headers will be added to responses.",
      "propertyOrder" : 1,
      "required" : true,
      "type" : "boolean",
      "exampleValue" : ""
    }
  }
}
```

CRESTReporter

Global Operations

Resource path: `/global-config/services/monitoring/crest`

Resource version: `1.0`

create

Usage:

```
am> create CRESTReporter --global --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "enabled" : {
      "title" : "Enabled",
      "description" : "",
      "propertyOrder" : 100,
      "required" : true,
      "type" : "boolean",
      "exampleValue" : ""
    }
  }
}
```

delete

Usage:

```
am> delete CRESTReporter --global --id id
```

Parameters:

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action CRESTReporter --global --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action CRESTReporter --global --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action CRESTReporter --global --actionName nextdescendents
```

query

Get the full list of instances of this collection. This query only supports `_queryFilter=true` filter.

Usage:

```
am> query CRESTReporter --global --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read CRESTReporter --global --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update CRESTReporter --global --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "enabled" : {
      "title" : "Enabled",
      "description" : "",
      "propertyOrder" : 100,
      "required" : true,
      "type" : "boolean",
      "exampleValue" : ""
    }
  }
}
```

Captcha

Realm Operations

Resource path: `/realm-config/authentication/authenticationtrees/nodes/product-ReCaptchaNode`

Resource version: `1.0`

create

Usage:

```
am> create Captcha --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "reCaptchaUri" : {
      "title" : "CAPTCHA Verification URL",
      "description" : "URL to Verify CAPTCHA, defaults to the Google ReCAPTCHA verification URI.",
      "propertyOrder" : 300,
      "type" : "string",
      "exampleValue" : ""
    },
    "divClass" : {
      "title" : "Class of CAPTCHA HTML <div>",
      "description" : "The class of the HTML <div> element required by the captcha API, defaults to
 Google the ReCAPTCHA <div>.",
      "propertyOrder" : 500,
      "type" : "string",
      "exampleValue" : ""
    },
    "secretKey" : {
      "title" : "CAPTCHA Secret Key",
      "description" : "CAPTCHA Secret Key",
      "propertyOrder" : 200,
      "type" : "string",
      "exampleValue" : ""
    },
    "siteKey" : {
      "title" : "CAPTCHA Site Key",
      "description" : "CAPTCHA Site Key",
      "propertyOrder" : 100,
      "type" : "string",
      "exampleValue" : ""
    },
    "apiUri" : {
      "title" : "CAPTCHA API URL",
      "description" : "The URL of the JavaScript to load the CAPTCHA verification, defaults to the
 Google ReCAPTCHA API.",
      "propertyOrder" : 400,
      "type" : "string",
      "exampleValue" : ""
    }
  },
  "required" : [ "apiUri", "reCaptchaUri", "siteKey", "divClass", "secretKey" ]
}
```

delete

Usage:

```
am> delete Captcha --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action Captcha --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action Captcha --realm Realm --actionName getCreatableTypes
```

listOutcomes

List the available outcomes for the node type.

Usage:

```
am> action Captcha --realm Realm --body body --actionName listOutcomes
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "title" : "Some configuration of the node. This does not need to be complete against the
 configuration schema."
}
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action Captcha --realm Realm --actionName nextdescendents
```

query

Get the full list of instances of this collection. This query only supports `_queryFilter=true` filter.

Usage:

```
am> query Captcha --realm Realm --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read Captcha --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update Captcha --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "reCaptchaUri" : {
      "title" : "CAPTCHA Verification URL",
```

```
      "description" : "URL to Verify CAPTCHA, defaults to the Google ReCAPTCHA verification URI.",
      "propertyOrder" : 300,
      "type" : "string",
      "exampleValue" : ""
    },
    "divClass" : {
      "title" : "Class of CAPTCHA HTML <div>",
      "description" : "The class of the HTML <div> element required by the captcha API, defaults to
 Google the ReCAPTCHA <div>.",
      "propertyOrder" : 500,
      "type" : "string",
      "exampleValue" : ""
    },
    "secretKey" : {
      "title" : "CAPTCHA Secret Key",
      "description" : "CAPTCHA Secret Key",
      "propertyOrder" : 200,
      "type" : "string",
      "exampleValue" : ""
    },
    "siteKey" : {
      "title" : "CAPTCHA Site Key",
      "description" : "CAPTCHA Site Key",
      "propertyOrder" : 100,
      "type" : "string",
      "exampleValue" : ""
    },
    "apiUri" : {
      "title" : "CAPTCHA API URL",
      "description" : "The URL of the JavaScript to load the CAPTCHA verification, defaults to the
 Google ReCAPTCHA API.",
      "propertyOrder" : 400,
      "type" : "string",
      "exampleValue" : ""
    }
  },
  "required" : [ "apiUri", "reCaptchaUri", "siteKey", "divClass", "secretKey" ]
}
```

CertificateCollectorNode

Realm Operations

Resource path: `/realm-config/authentication/authenticationtrees/nodes/product-CertificateCollectorNode`

Resource version: `1.0`

create

Usage:

```
am> create CertificateCollectorNode --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "clientCertificateHttpHeaderName" : {
      "title" : "HTTP Header Name for Client Certificate",
      "description" : "The name of the HTTP request header containing the certificate, only used when
 header based collection is enabled.",
      "propertyOrder" : 200,
      "type" : "string",
      "exampleValue" : ""
    },
    "trustedRemoteHosts" : {
      "title" : "Trusted Remote Hosts",
      "description" : "A list of IP addresses trusted to supply client certificates.<br><br>If SSL/
TLS is being terminated at a load balancer or at the Distributed Authentication server then this
 option can be used to ensure that only specified trusted hosts (identified by IP address) are allowed
 to supply client certificates to the certificate node.<br><br>Empty list means do not trust remote
 headers and a single value of \"any\" means all are trusted <code>any</code>.",
      "propertyOrder" : 300,
      "items" : {
        "type" : "string"
      },
      "type" : "array",
      "exampleValue" : ""
    },
    "certificateCollectionMethod" : {
      "title" : "Certificate Collection Method",
      "description" : "This field defines how the certificate should be client certificate should
 be collected from the request. If TLS termination happens at the web container that is running
 Access Management, choose <code>Request</code>. If you have Access Management behind a proxy or load
 balancer and terminate TLS there, select <code>Header</code>. If <code>Either</code> is selected,
 the collector node will first look at the request, then look at the <code>HTTP Header Name for Client
 Certificate</code> specified in that order.",
      "propertyOrder" : 100,
      "type" : "string",
      "exampleValue" : ""
    }
  },
  "required" : [ "certificateCollectionMethod", "trustedRemoteHosts" ]
}
```

delete

Usage:

```
am> delete CertificateCollectorNode --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action CertificateCollectorNode --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action CertificateCollectorNode --realm Realm --actionName getCreatableTypes
```

listOutcomes

List the available outcomes for the node type.

Usage:

```
am> action CertificateCollectorNode --realm Realm --body body --actionName listOutcomes
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "title" : "Some configuration of the node. This does not need to be complete against the
 configuration schema."
}
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action CertificateCollectorNode --realm Realm --actionName nextdescendents
```

query

Get the full list of instances of this collection. This query only supports `_queryFilter=true` filter.

Usage:

```
am> query CertificateCollectorNode --realm Realm --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read CertificateCollectorNode --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update CertificateCollectorNode --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "clientCertificateHttpHeaderName" : {
      "title" : "HTTP Header Name for Client Certificate",
      "description" : "The name of the HTTP request header containing the certificate, only used when
 header based collection is enabled.",
      "propertyOrder" : 200,
      "type" : "string",
      "exampleValue" : ""
    },
    "trustedRemoteHosts" : {
      "title" : "Trusted Remote Hosts",
      "description" : "A list of IP addresses trusted to supply client certificates.<br><br>If SSL/
TLS is being terminated at a load balancer or at the Distributed Authentication server then this
 option can be used to ensure that only specified trusted hosts (identified by IP address) are allowed
 to supply client certificates to the certificate node.<br><br>Empty list means do not trust remote
 headers and a single value of \"any\" means all are trusted <code>any</code>.",
      "propertyOrder" : 300,
      "items" : {
        "type" : "string"
      },
      "type" : "array",
      "exampleValue" : ""
    },

```

delete

Usage:

```
am> delete CertificateModule --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action CertificateModule --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action CertificateModule --realm Realm --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action CertificateModule --realm Realm --actionName nextdescendents
```

query

Get the full list of instances of this collection. This query only supports `_queryFilter=true` filter.

Usage:

```
am> query CertificateModule --realm Realm --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read CertificateModule --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update CertificateModule --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{

Global Operations

Resource path: `/global-config/authentication/modules/certificate`

Resource version: `1.0`

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action CertificateModule --global --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action CertificateModule --global --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action CertificateModule --global --actionName nextdescendents
```

read

Usage:

```
am> read CertificateModule --global
```

update

Usage:

```
am> update CertificateModule --global --body body
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "defaults" : {
```

```
     "properties" : {
       "crlHttpParameters" : {
         "title" : "HTTP Parameters for CRL Update",
         "description" : "These parameters will be included in any HTTP CRL call to the Certificate
 Authority<br><br>If the Client or CA certificate contains the Issuing Distribution Point Extension
 then OpenAM will use this information to retrieve the CRL from the distribution point. This property
 allow custom HTTP parameters to be included in the CRL request.<br/><br/>The format of the parameter
 is as follows:<br/><br/><code>param1=value1,param2=value</code>",
         "propertyOrder" : 500,
         "required" : true,

CertificateUserExtractorNode

Realm Operations

Resource path: `/realm-config/authentication/authenticationtrees/nodes/product-CertificateUserExtractorNode`

Resource version: `1.0`

create

Usage:

```
am> create CertificateUserExtractorNode --realm Realm --id id --body body
```

Parameters:

`--id`

The unique identifier for the resource.

`--body`

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "certificateAttributeProfileMappingExtension" : {
      "title" : "SubjectAltNameExt Value Type to Access User Profile",
      "description" : "Use the Subject Alternative Name Field in preference to one of the standard
 certificate fields.<br><br>Selecting RFC822Name or UPN will cause this field to have have precedence
 over the <em>Certificate Field Used to Access User Profile</em> or <em>Other Certificate Field Used
 to Access User Profile</em> attribute.",
      "propertyOrder" : 300,
      "type" : "string",
      "exampleValue" : ""
    },
    "otherCertificateAttributeToProfileMapping" : {
      "title" : "Other Certificate Field Used to Access User Profile",
      "description" : "This field is only used if the <em>Certificate Field Used to Access User
 Profile</em> attribute is set to <em>other</em>. This field allows a custom certificate field to be
 used as the basis of the user search.",
      "propertyOrder" : 200,
      "type" : "string",
      "exampleValue" : ""
    },
    "certificateAttributeToProfileMapping" : {
      "title" : "Certificate Field Used to Access User Profile",
      "description" : "The certificate node needs to read a value from the client certificate that can
 be used to search the LDAP server for the user. This value from the certificate will be populated in
 shared state under the username key.",
      "propertyOrder" : 100,
      "type" : "string",
      "exampleValue" : ""
    }
  },
  "required" : [ "certificateAttributeToProfileMapping",
 "certificateAttributeProfileMappingExtension" ]
}
```

delete

Usage:

```
am> delete CertificateUserExtractorNode --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action CertificateUserExtractorNode --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action CertificateUserExtractorNode --realm Realm --actionName getCreatableTypes
```

listOutcomes

List the available outcomes for the node type.

Usage:

```
am> action CertificateUserExtractorNode --realm Realm --body body --actionName listOutcomes
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "title" : "Some configuration of the node. This does not need to be complete against the
 configuration schema."
}
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action CertificateUserExtractorNode --realm Realm --actionName nextdescendents
```

query

Get the full list of instances of this collection. This query only supports `_queryFilter=true` filter.

Usage:

```
am> query CertificateUserExtractorNode --realm Realm --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read CertificateUserExtractorNode --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update CertificateUserExtractorNode --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "certificateAttributeProfileMappingExtension" : {
      "title" : "SubjectAltNameExt Value Type to Access User Profile",

 "ldapSearchStartDN", "crlMatchingCertificateAttribute" ]
}
```

delete

Usage:

```
am> delete CertificateValidationNode --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action CertificateValidationNode --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action CertificateValidationNode --realm Realm --actionName getCreatableTypes
```

listOutcomes

List the available outcomes for the node type.

Usage:

```
am> action CertificateValidationNode --realm Realm --body body --actionName listOutcomes
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "title" : "Some configuration of the node. This does not need to be complete against the
 configuration schema."
}
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action CertificateValidationNode --realm Realm --actionName nextdescendents
```

query

Get the full list of instances of this collection. This query only supports `_queryFilter=true` filter.

Usage:

```
am> query CertificateValidationNode --realm Realm --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read CertificateValidationNode --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update CertificateValidationNode --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "userBindDN" : {
      "title" : "LDAP Server Authentication User",
      "description" : "DN of the user used by the node to authenticate to the LDAP server.<br><br>The
 Certificate node authenticates to the LDAP server in order to search for a matching certificate. The
 DN entered here represents the account used for said authentication and must have read/search access
 to the LDAP server.",

ChoiceCollector

Realm Operations

Resource path: `/realm-config/authentication/authenticationtrees/nodes/ChoiceCollectorNode`

Resource version: `1.0`

create

Usage:

```
am> create ChoiceCollector --realm Realm --id id --body body
```

Parameters:

`--id`

The unique identifier for the resource.

`--body`

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "choices" : {
      "title" : "Choices",
      "description" : "List of values that represents the choices for the user.",
      "propertyOrder" : 100,
      "items" : {
        "type" : "string"
      },
      "type" : "array",
      "exampleValue" : ""
    },
    "defaultChoice" : {
      "title" : "Default Choice",
      "description" : "The default selected choice value.",
      "propertyOrder" : 200,
      "type" : "string",
      "exampleValue" : ""
    },
    "prompt" : {
      "title" : "Prompt",
      "description" : "Prompt displayed on the choice page.",
      "propertyOrder" : 300,
      "type" : "string",
      "exampleValue" : ""
    }
  },
  "required" : [ "prompt", "defaultChoice", "choices" ]
}
```

delete

Usage:

```
am> delete ChoiceCollector --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action ChoiceCollector --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action ChoiceCollector --realm Realm --actionName getCreatableTypes
```

listOutcomes

List the available outcomes for the node type.

Usage:

```
am> action ChoiceCollector --realm Realm --body body --actionName listOutcomes
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "title" : "Some configuration of the node. This does not need to be complete against the
 configuration schema."
}
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action ChoiceCollector --realm Realm --actionName nextdescendents
```

query

Get the full list of instances of this collection. This query only supports `_queryFilter=true` filter.

Usage:

```
am> query ChoiceCollector --realm Realm --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read ChoiceCollector --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update ChoiceCollector --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "choices" : {
      "title" : "Choices",
      "description" : "List of values that represents the choices for the user.",
      "propertyOrder" : 100,
      "items" : {
        "type" : "string"
      },
      "type" : "array",
      "exampleValue" : ""
    },
    "defaultChoice" : {
      "title" : "Default Choice",
      "description" : "The default selected choice value.",
      "propertyOrder" : 200,
      "type" : "string",
      "exampleValue" : ""
    },
    "prompt" : {
      "title" : "Prompt",
      "description" : "Prompt displayed on the choice page.",
      "propertyOrder" : 300,
      "type" : "string",
      "exampleValue" : ""
    }
  },
  "required" : [ "prompt", "defaultChoice", "choices" ]
}
```

CircleOfTrust

Realm Operations

Resource path: `/realm-config/federation/circlesoftrust`

Resource version: `1.0`

create

Usage:

```
am> create CircleOfTrust --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "description" : {
      "title" : "Description",
      "description" : "",
      "propertyOrder" : 100,
      "required" : false,
      "type" : "string",
      "exampleValue" : ""
    },
    "saml2ReaderServiceUrl" : {
      "title" : "SAML2 Reader Service URL",
      "description" : "Location of the SAML2 Reader service that reads the cookie from the Common
 Domain.",
      "propertyOrder" : 500,
      "required" : false,
      "type" : "string",
      "exampleValue" : ""
    },
    "status" : {
      "title" : "Status",
      "description" : "",
      "propertyOrder" : 200,
      "required" : false,
      "type" : "string",
      "exampleValue" : ""
    },
    "saml2WriterServiceUrl" : {
```

```
      "title" : "SAML2 Writer Service URL",
      "description" : "Location of the SAML2 Writer service that writes the cookie to the Common
 Domain.",
      "propertyOrder" : 400,
      "required" : false,
      "type" : "string",
      "exampleValue" : ""
    },
    "trustedProviders" : {
      "title" : "Entity Providers",
      "description" : "Minimum requirements for a circle of trust are one identity provider and one
 service provider.",
      "propertyOrder" : 300,
      "required" : false,
      "items" : {
        "type" : "string"
      },
      "type" : "array",
      "exampleValue" : ""
    }
  }
}
```

delete

Usage:

```
am> delete CircleOfTrust --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

query

Get the full list of instances of this collection. This query only supports `_queryFilter=true` filter.

Usage:

```
am> query CircleOfTrust --realm Realm --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read CircleOfTrust --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update CircleOfTrust --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "description" : {
      "title" : "Description",
      "description" : "",
      "propertyOrder" : 100,
      "required" : false,
      "type" : "string",
      "exampleValue" : ""
    },

      "required" : false,
      "type" : "string",
      "exampleValue" : ""
    },
    "status" : {
      "title" : "Status",
      "description" : "",
      "propertyOrder" : 200,
      "required" : false,
      "type" : "string",
      "exampleValue" : ""
    },
    "saml2WriterServiceUrl" : {
      "title" : "SAML2 Writer Service URL",
      "description" : "Location of the SAML2 Writer service that writes the cookie to the Common
 Domain.",
```

```
      "propertyOrder" : 400,
      "required" : false,
      "type" : "string",
      "exampleValue" : ""
    },
    "trustedProviders" : {
      "title" : "Entity Providers",
      "description" : "Minimum requirements for a circle of trust are one identity provider and one
 service provider.",
      "propertyOrder" : 300,
      "required" : false,
      "items" : {
        "type" : "string"
      },
      "type" : "array",
      "exampleValue" : ""
    }
  }
}
```

CommonFederationConfiguration

Global Operations

Resource path: `/global-config/services/federation/common`

Resource version: `1.0`

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action CommonFederationConfiguration --global --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action CommonFederationConfiguration --global --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action CommonFederationConfiguration --global --actionName nextdescendents
```

read

Usage:

```
am> read CommonFederationConfiguration --global
```

update

Usage:

```
am> update CommonFederationConfiguration --global --body body
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {

}
```

ConditionTypes

Realm Operations

Service for querying and reading the environment condition types stored in OpenAM. Environment condition types describe the JSON representation of environment conditions that you can use in policy definitions

Resource path: `/conditiontypes`

Resource version: `1.0`

query

Query the list of environment condition types

Usage:

```
am> query ConditionTypes --realm Realm --filter filter
```

Parameters:

`--filter`

A CREST formatted query filter, where "true" will query all. Fields that can be queried: [*]

read

Read an individual environment condition type by providing the unique identifier title

Usage:

```
am> read ConditionTypes --realm Realm --id id
```

Parameters:

`--id`

The unique identifier for the resource.

ConfigurationVersionService

Global Operations

Resource path: `/global-config/services/ConfigurationVersionService`

Resource version: `1.0`

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action ConfigurationVersionService --global --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action ConfigurationVersionService --global --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action ConfigurationVersionService --global --actionName nextdescendents
```

read

Usage:

```
am> read ConfigurationVersionService --global
```

update

Usage:

```
am> update ConfigurationVersionService --global --body body
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "configurationVersion" : {
      "title" : "Configuration Version",
      "description" : "AM's configuration version",
      "propertyOrder" : null,
      "required" : true,
      "type" : "string",
      "exampleValue" : ""
    }
  }
}
```

ConsentCollector

Realm Operations

Resource path: `/realm-config/authentication/authenticationtrees/nodes/ConsentNode`

Resource version: `1.0`

create

Usage:

```
am> create ConsentCollector --realm Realm --id id --body body
```

Parameters:

`--id`

The unique identifier for the resource.

`--body`

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "allRequired" : {
      "title" : "All Mappings Required",
      "description" : "All mappings listed by this node require consent in order to move forward.",
      "propertyOrder" : 100,
      "type" : "boolean",
      "exampleValue" : ""
    },
    "message" : {
      "title" : "Privacy & Consent Message",
      "description" : "Localised message providing the privacy and consent notice.",
      "propertyOrder" : 200,
      "patternProperties" : {
        ".*" : {
          "type" : "string"
        }
      },
      "type" : "object",
      "exampleValue" : ""
    }
  },
  "required" : [ "message", "allRequired" ]
}
```

delete

Usage:

```
am> delete ConsentCollector --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action ConsentCollector --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action ConsentCollector --realm Realm --actionName getCreatableTypes
```

listOutcomes

List the available outcomes for the node type.

Usage:

```
am> action ConsentCollector --realm Realm --body body --actionName listOutcomes
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "title" : "Some configuration of the node. This does not need to be complete against the
 configuration schema."
}
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action ConsentCollector --realm Realm --actionName nextdescendents
```

query

Get the full list of instances of this collection. This query only supports `_queryFilter=true` filter.

Usage:

```
am> query ConsentCollector --realm Realm --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read ConsentCollector --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update ConsentCollector --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "allRequired" : {
      "title" : "All Mappings Required",
      "description" : "All mappings listed by this node require consent in order to move forward.",
      "propertyOrder" : 100,
      "type" : "boolean",
      "exampleValue" : ""
    },
    "message" : {
      "title" : "Privacy & Consent Message",
      "description" : "Localised message providing the privacy and consent notice.",
      "propertyOrder" : 200,
      "patternProperties" : {
        ".*" : {
          "type" : "string"
        }
      },
      "type" : "object",
      "exampleValue" : ""
    }
  },
  "required" : [ "message", "allRequired" ]
}
```

CookiePresenceDecisionNode

Realm Operations

Resource path: `/realm-config/authentication/authenticationtrees/nodes/CookiePresenceDecisionNode`

Resource version: `1.0`

create

Usage:

```
am> create CookiePresenceDecisionNode --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "cookieName" : {
      "title" : "Name of Cookie",
      "description" : "",
      "propertyOrder" : 100,
      "type" : "string",
      "exampleValue" : ""
    }
  },
  "required" : [ "cookieName" ]
}
```

delete

Usage:

```
am> delete CookiePresenceDecisionNode --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action CookiePresenceDecisionNode --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action CookiePresenceDecisionNode --realm Realm --actionName getCreatableTypes
```

listOutcomes

List the available outcomes for the node type.

Usage:

```
am> action CookiePresenceDecisionNode --realm Realm --body body --actionName listOutcomes
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "title" : "Some configuration of the node. This does not need to be complete against the
 configuration schema."
}
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action CookiePresenceDecisionNode --realm Realm --actionName nextdescendents
```

query

Get the full list of instances of this collection. This query only supports `_queryFilter=true` filter.

Usage:

```
am> query CookiePresenceDecisionNode --realm Realm --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read CookiePresenceDecisionNode --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update CookiePresenceDecisionNode --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "cookieName" : {
      "title" : "Name of Cookie",
      "description" : "",
      "propertyOrder" : 100,
      "type" : "string",
      "exampleValue" : ""
    }
  },
  "required" : [ "cookieName" ]
}
```

CorsConfiguration

Global Operations

Resource path: `/global-config/services/CorsService/configuration`

Resource version: `1.0`

create

Usage:

```
am> create CorsConfiguration --global --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "exposedHeaders" : {
      "title" : "Exposed Headers",
      "description" : "The set of headers to transmit in the header Access-Control-Expose-Headers.",
      "propertyOrder" : 40,
      "required" : true,
      "items" : {
        "type" : "string"
      },
      "type" : "array",
      "exampleValue" : ""
    },
    "enabled" : {
      "title" : "Enable the CORS filter",
      "description" : "If disable, no CORS headers will be added to responses.",
      "propertyOrder" : 2,
      "required" : true,
      "type" : "boolean",
      "exampleValue" : ""
    },
    "acceptedMethods" : {
      "title" : "Accepted Methods",
      "description" : "The set of (non-simple) accepted methods, included in the pre-flight response
 in the header Access-Control-Allow-Methods.",
      "propertyOrder" : 20,
      "required" : true,
      "items" : {
        "type" : "string"
      },
      "type" : "array",
      "exampleValue" : ""
    },
```

```
    "allowCredentials" : {
      "title" : "Allow Credentials",
      "description" : "Whether to transmit the Access-Control-Allow-Credentials: true header in the
 response.",
      "propertyOrder" : 60,
      "required" : true,
      "type" : "boolean",
      "exampleValue" : ""
    },
    "acceptedHeaders" : {
      "title" : "Accepted Headers",
      "description" : "The set of (non-simple) accepted headers, included in the pre-flight response
 in the header Access-Control-Allow-Headers.",
      "propertyOrder" : 30,
      "required" : true,
      "items" : {
        "type" : "string"
      },
      "type" : "array",
      "exampleValue" : ""
    },
    "maxAge" : {
      "title" : "Max Age",
      "description" : "The max age (in seconds) for caching, included in the pre-flight response in
 the header Access-Control-Max-Age.",
      "propertyOrder" : 50,
      "required" : true,
      "type" : "integer",
      "exampleValue" : ""
    },
    "acceptedOrigins" : {
      "title" : "Accepted Origins",
      "description" : "The set of accepted origins.",
      "propertyOrder" : 10,
      "required" : true,
      "items" : {
        "type" : "string"
      },
      "type" : "array",
      "exampleValue" : ""
    }
  }
}
```

delete

Usage:

```
am> delete CorsConfiguration --global --id id
```

Parameters:

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action CorsConfiguration --global --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action CorsConfiguration --global --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action CorsConfiguration --global --actionName nextdescendents
```

query

Get the full list of instances of this collection. This query only supports `_queryFilter=true` filter.

Usage:

```
am> query CorsConfiguration --global --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read CorsConfiguration --global --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update CorsConfiguration --global --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "exposedHeaders" : {
      "title" : "Exposed Headers",
      "description" : "The set of headers to transmit in the header Access-Control-Expose-Headers.",

}
```

CreateObject

Realm Operations

Resource path: `/realm-config/authentication/authenticationtrees/nodes/CreateObjectNode`

Resource version: `1.0`

create

Usage:

```
am> create CreateObject --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "identityResource" : {
      "title" : "Identity Resource",
      "description" : "The identity resource in IDM that this node will create. This is used to aid
 node input requirement declaration.  Must match identity resource of the current tree.",
      "propertyOrder" : 100,
      "type" : "string",
      "exampleValue" : ""
    }
  },
  "required" : [ "identityResource" ]
}
```

delete

Usage:

```
am> delete CreateObject --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action CreateObject --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action CreateObject --realm Realm --actionName getCreatableTypes
```

listOutcomes

List the available outcomes for the node type.

Usage:

```
am> action CreateObject --realm Realm --body body --actionName listOutcomes
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "title" : "Some configuration of the node. This does not need to be complete against the
 configuration schema."
}
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action CreateObject --realm Realm --actionName nextdescendents
```

query

Get the full list of instances of this collection. This query only supports `_queryFilter=true` filter.

Usage:

```
am> query CreateObject --realm Realm --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read CreateObject --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update CreateObject --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "identityResource" : {
      "title" : "Identity Resource",
      "description" : "The identity resource in IDM that this node will create. This is used to aid
 node input requirement declaration.  Must match identity resource of the current tree.",
      "propertyOrder" : 100,
      "type" : "string",
      "exampleValue" : ""
    }
  },
  "required" : [ "identityResource" ]
}
```

CreatePassword

Realm Operations

Resource path: `/realm-config/authentication/authenticationtrees/nodes/CreatePasswordNode`

Resource version: `1.0`

create

Usage:

```
am> create CreatePassword --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "minPasswordLength" : {
      "title" : "minPasswordLength",
      "description" : "",
      "propertyOrder" : 100,
      "type" : "integer",
      "exampleValue" : ""
    }
  },
  "required" : [ "minPasswordLength" ]
}
```

delete

Usage:

```
am> delete CreatePassword --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action CreatePassword --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action CreatePassword --realm Realm --actionName getCreatableTypes
```

listOutcomes

List the available outcomes for the node type.

Usage:

```
am> action CreatePassword --realm Realm --body body --actionName listOutcomes
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "title" : "Some configuration of the node. This does not need to be complete against the
 configuration schema."
}
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action CreatePassword --realm Realm --actionName nextdescendents
```

query

Get the full list of instances of this collection. This query only supports `_queryFilter=true` filter.

Usage:

```
am> query CreatePassword --realm Realm --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read CreatePassword --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update CreatePassword --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "minPasswordLength" : {
      "title" : "minPasswordLength",
      "description" : "",
      "propertyOrder" : 100,
      "type" : "integer",
      "exampleValue" : ""
    }
  },
  "required" : [ "minPasswordLength" ]
}
```

Csv

Realm Operations

Resource path: `/realm-config/services/audit/CSV`

Resource version: `1.0`

create

Usage:

```
am> create Csv --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "csvFileRetention" : {
      "type" : "object",

        }
      }
    }
  }
}
```

delete

Usage:

```
am> delete Csv --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action Csv --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action Csv --realm Realm --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action Csv --realm Realm --actionName nextdescendents
```

query

Get the full list of instances of this collection. This query only supports `_queryFilter=true` filter.

Usage:

```
am> query Csv --realm Realm --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read Csv --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update Csv --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "csvFileRetention" : {
      "type" : "object",

Global Operations

Resource path: `/global-config/services/audit/CSV`

Resource version: `1.0`

create

Usage:

```
am> create Csv --global --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "csvFileRetention" : {
      "type" : "object",
      "title" : "File Retention",
      "propertyOrder" : 4,
      "properties" : {
        "retentionMinFreeSpaceRequired" : {
          "title" : "Minimum Free Space Required",
          "description" : "Minimum amount of disk space required, in bytes, on the system where audit
 files are stored. A negative or zero value indicates this policy is disabled.",
          "propertyOrder" : 1400,
          "required" : true,
          "type" : "string",
          "exampleValue" : ""
        },
        "retentionMaxNumberOfHistoryFiles" : {
          "title" : "Maximum Number of Historical Files",
```

```
          "description" : "Maximum number of backup audit files allowed. A value of <code>-1</code>
disables pruning of old history files.",

    }
  }
}
```

delete

Usage:

```
am> delete Csv --global --id id
```

Parameters:

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action Csv --global --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action Csv --global --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action Csv --global --actionName nextdescendents
```

query

Get the full list of instances of this collection. This query only supports `_queryFilter=true` filter.

Usage:

```
am> query Csv --global --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read Csv --global --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update Csv --global --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```

```

CtsDataStoreProperties

Global Operations

An object of property key-value pairs

Resource path: `/global-config/servers/{serverName}/properties/cts`

Resource version: `1.0`

read

Usage:

```
am> read CtsDataStoreProperties --global --serverName serverName
```

Parameters:

`--serverName`

An object of property key-value pairs

update

Usage:

```
am> update CtsDataStoreProperties --global --serverName serverName --body body
```

Parameters:

`--serverName`

An object of property key-value pairs

`--body`

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "amconfig.org.forgerock.services.cts.store.common.section" : {
      "title" : "CTS Token Store",
      "type" : "object",
      "propertyOrder" : 0,
      "properties" : {
        "org.forgerock.services.cts.store.location" : {
          "title" : "Store Mode",
          "type" : "object",
          "propertyOrder" : 0,
          "description" : "",
```

```
          "properties" : {
            "value" : {

```

Dashboard

Realm Operations

Resource path: `/realm-config/services/dashboard`

Resource version: `1.0`

create

Usage:

```
am> create Dashboard --realm Realm --body body
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "assignedDashboard" : {
      "title" : "Available Dashboard Apps",
      "description" : "List of application dashboard names available by default for realms with the
 Dashboard service configured.",
      "propertyOrder" : 700,
      "required" : true,
      "items" : {
        "type" : "string"
      },
      "type" : "array",
      "exampleValue" : ""
    }
  }
}
```

delete

Usage:

```
am> delete Dashboard --realm Realm
```

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action Dashboard --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action Dashboard --realm Realm --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action Dashboard --realm Realm --actionName nextdescendents
```

read

Usage:

```
am> read Dashboard --realm Realm
```

update

Usage:

```
am> update Dashboard --realm Realm --body body
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "assignedDashboard" : {
      "title" : "Available Dashboard Apps",
      "description" : "List of application dashboard names available by default for realms with the
 Dashboard service configured.",
      "propertyOrder" : 700,
      "required" : true,
      "items" : {
        "type" : "string"
      },
      "type" : "array",
      "exampleValue" : ""
    }
  }
}
```

Global Operations

Resource path: `/global-config/services/dashboard`

Resource version: `1.0`

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action Dashboard --global --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action Dashboard --global --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action Dashboard --global --actionName nextdescendents
```

read

Usage:

```
am> read Dashboard --global
```

update

Usage:

```
am> update Dashboard --global --body body
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "defaults" : {
      "properties" : {
        "assignedDashboard" : {
          "title" : "Available Dashboard Apps",
          "description" : "List of application dashboard names available by default for realms with
 the Dashboard service configured.",
          "propertyOrder" : 700,
          "required" : true,
          "items" : {
            "type" : "string"
          },
          "type" : "array",
          "exampleValue" : ""
        }
      },
      "type" : "object",
      "title" : "Realm Defaults"
    }
  }
}
```

DashboardInstance

Global Operations

Resource path: `/global-config/services/dashboard/instances`

Resource version: `1.0`

create

Usage:

```
am> create DashboardInstance --global --id id --body body
```

Parameters:

`--id`

The unique identifier for the resource.

`--body`

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
```

```
  "properties" : {
    "icfIdentifier" : {
      "title" : "ICF Identifier",
      "description" : "",
      "propertyOrder" : 600,
      "required" : true,
      "type" : "string",
      "exampleValue" : ""
    },
    "name" : {
      "title" : "Dashboard Name",
      "description" : "The application name as it will appear to the administrator for configuring the
 dashboard.",
      "propertyOrder" : 200,
      "required" : true,
      "type" : "string",
      "exampleValue" : ""
    },
    "login" : {
      "title" : "Dashboard Login",
      "description" : "The URL that takes the user to the application.",
      "propertyOrder" : 500,
      "required" : true,
      "type" : "string",
      "exampleValue" : ""
    },
    "displayName" : {
      "title" : "Dashboard Display Name",
      "description" : "The application name that displays on the dashboard client.",
      "propertyOrder" : 300,
      "required" : true,
      "type" : "string",
      "exampleValue" : ""
    },
    "className" : {
      "title" : "Dashboard Class Name",
      "description" : "Identifies how to access the application, for example
 <code>SAML2ApplicationClass</code> for a SAML v2.0 application.",
      "propertyOrder" : 100,
      "required" : true,
      "type" : "string",
      "exampleValue" : ""
    },
    "icon" : {
      "title" : "Dashboard Icon",
      "description" : "The icon name that will be displayed on the dashboard client identifying the
 application.",
      "propertyOrder" : 400,
      "required" : true,
      "type" : "string",
      "exampleValue" : ""
    }
  }
}
```

delete

Usage:

```
am> delete DashboardInstance --global --id id
```

Parameters:

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action DashboardInstance --global --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action DashboardInstance --global --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action DashboardInstance --global --actionName nextdescendents
```

query

Get the full list of instances of this collection. This query only supports `_queryFilter=true` filter.

Usage:

```
am> query DashboardInstance --global --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read DashboardInstance --global --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update DashboardInstance --global --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "icfIdentifier" : {
      "title" : "ICF Identifier",
      "description" : "",
      "propertyOrder" : 600,
      "required" : true,
      "type" : "string",
      "exampleValue" : ""
    },
    "name" : {
      "title" : "Dashboard Name",
      "description" : "The application name as it will appear to the administrator for configuring the
 dashboard.",
      "propertyOrder" : 200,
      "required" : true,
      "type" : "string",
      "exampleValue" : ""
    },
    "login" : {
      "title" : "Dashboard Login",
      "description" : "The URL that takes the user to the application.",
```

```
      "propertyOrder" : 500,
      "required" : true,
      "type" : "string",
      "exampleValue" : ""
    },
    "displayName" : {
      "title" : "Dashboard Display Name",
      "description" : "The application name that displays on the dashboard client.",
      "propertyOrder" : 300,
      "required" : true,
      "type" : "string",
      "exampleValue" : ""
    },
    "className" : {
      "title" : "Dashboard Class Name",
      "description" : "Identifies how to access the application, for example
 <code>SAML2ApplicationClass</code> for a SAML v2.0 application.",
      "propertyOrder" : 100,
      "required" : true,
      "type" : "string",
      "exampleValue" : ""
    },
    "icon" : {
      "title" : "Dashboard Icon",
      "description" : "The icon name that will be displayed on the dashboard client identifying the
 application.",
      "propertyOrder" : 400,
      "required" : true,
      "type" : "string",
      "exampleValue" : ""
    }
  }
}
```

DashboardUserService

Realm Operations

Resource path: `/users/{user}/services/dashboard`

Resource version: `1.0`

create

Usage:

```
am> create DashboardUserService --realm Realm --body body
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "assignedDashboard" : {
      "title" : "Assigned Dashboard",
      "description" : "",
      "propertyOrder" : 800,
      "required" : true,
      "items" : {
        "type" : "string"
      },
      "type" : "array",
      "exampleValue" : ""
    }
  }
}
```

delete

Usage:

```
am> delete DashboardUserService --realm Realm
```

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action DashboardUserService --realm Realm --user user --actionName getAllTypes
```

Parameters:

--user

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action DashboardUserService --realm Realm --user user --actionName getCreatableTypes
```

Parameters:

--user

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action DashboardUserService --realm Realm --user user --actionName nextdescendents
```

Parameters:

--user

read

Usage:

```
am> read DashboardUserService --realm Realm
```

unassignServices

action.unassignServices.description

Usage:

```
am> action DashboardUserService --realm Realm --body body --user user --actionName unassignServices
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "description" : "i18n:api-descriptor/UserServicesResource#schema.description",
  "type" : "object",
  "title" : "i18n:api-descriptor/UserServicesResource#schema.title",
  "properties" : {
    "serviceNames" : {
      "type" : "array",
      "title" : "i18n:api-descriptor/UserServicesResource#schema.servicename.title",
      "description" : "i18n:api-descriptor/UserServicesResource#schema.servicename.description",
      "items" : {
        "type" : "string"
      }
    }
  }
}
```

--user

update

Usage:

```
am> update DashboardUserService --realm Realm --body body
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "assignedDashboard" : {
      "title" : "Assigned Dashboard",
      "description" : "",
      "propertyOrder" : 800,
      "required" : true,
      "items" : {
        "type" : "string"
      },
      "type" : "array",
      "exampleValue" : ""
    }
  }
}
```

Dashboards

Realm Operations

The dashboard service is responsible for returning information from the Dashboard. The only supported operation is read.

Resource path: `/dashboard`

Resource version: `1.0`

read

Read dashboard information

Usage:

```
am> read Dashboards --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

DataStoreDecision

Realm Operations

Resource path: `/realm-config/authentication/authenticationtrees/nodes/DataStoreDecisionNode`

Resource version: `1.0`

create

Usage:

```
am> create DataStoreDecision --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "required" : [ ]
}
```

delete

Usage:

```
am> delete DataStoreDecision --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action DataStoreDecision --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action DataStoreDecision --realm Realm --actionName getCreatableTypes
```

listOutcomes

List the available outcomes for the node type.

Usage:

```
am> action DataStoreDecision --realm Realm --body body --actionName listOutcomes
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "title" : "Some configuration of the node. This does not need to be complete against the
 configuration schema."
}
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action DataStoreDecision --realm Realm --actionName nextdescendents
```

query

Get the full list of instances of this collection. This query only supports `_queryFilter=true` filter.

Usage:

```
am> query DataStoreDecision --realm Realm --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read DataStoreDecision --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update DataStoreDecision --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "required" : [ ]
}
```

DataStoreInstance

Global Operations

Resource path: `/global-config/services/DataStoreService/config`

Resource version: `1.0`

create

Usage:

```
am> create DataStoreInstance --global --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "maximumConnectionPool" : {
      "title" : "Maximum Connection Pool Size",
      "description" : "",
      "propertyOrder" : 700,
      "required" : true,
      "type" : "integer",
      "exampleValue" : ""
    },
    "useSsl" : {
      "title" : "Use SSL",
      "description" : "",
      "propertyOrder" : 800,
      "required" : true,
      "type" : "boolean",
      "exampleValue" : ""
    },
    "affinityEnabled" : {
      "title" : "Affinity Enabled",
      "description" : "",
      "propertyOrder" : 1000,
      "required" : true,
      "type" : "boolean",
      "exampleValue" : ""
    },
    "minimumConnectionPool" : {
      "title" : "Minimum Connection Pool Size",
      "description" : "",
      "propertyOrder" : 600,
      "required" : true,
      "type" : "integer",
      "exampleValue" : ""
    },
    "useStartTLS" : {
      "title" : "Start TLS",
```

```
      "description" : "",
      "propertyOrder" : 900,
      "required" : true,
      "type" : "boolean",
      "exampleValue" : ""
    },
    "bindPassword" : {
      "title" : "Bind Password",
      "description" : "",
      "propertyOrder" : 500,
      "required" : true,
      "type" : "string",
      "format" : "password",
      "exampleValue" : ""
    },
    "serverUrls" : {
      "title" : "Host Urls",
      "description" : "An ordered list of connection strings for LDAP directories.Each connection
 string is composed as follows: HOST:PORT. serverHostname = Host Name",
      "propertyOrder" : 200,
      "required" : true,
      "items" : {
        "type" : "string"
      },
      "type" : "array",
      "exampleValue" : ""
    },
    "bindDN" : {
      "title" : "Bind DN",
      "description" : "",
      "propertyOrder" : 400,
      "required" : true,
      "type" : "string",
      "exampleValue" : ""
    }
  }
}
```

delete

Usage:

```
am> delete DataStoreInstance --global --id id
```

Parameters:

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action DataStoreInstance --global --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action DataStoreInstance --global --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action DataStoreInstance --global --actionName nextdescendents
```

query

Get the full list of instances of this collection. This query only supports `_queryFilter=true` filter.

Usage:

```
am> query DataStoreInstance --global --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read DataStoreInstance --global --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update DataStoreInstance --global --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "maximumConnectionPool" : {
      "title" : "Maximum Connection Pool Size",
      "description" : "",
      "propertyOrder" : 700,
      "required" : true,
      "type" : "integer",
      "exampleValue" : ""
    },
    "useSsl" : {
      "title" : "Use SSL",
      "description" : "",
      "propertyOrder" : 800,
      "required" : true,
      "type" : "boolean",
      "exampleValue" : ""
    },
    "affinityEnabled" : {
      "title" : "Affinity Enabled",
      "description" : "",
      "propertyOrder" : 1000,
      "required" : true,
      "type" : "boolean",
      "exampleValue" : ""
    },
    "minimumConnectionPool" : {
      "title" : "Minimum Connection Pool Size",
      "description" : "",
      "propertyOrder" : 600,
      "required" : true,
      "type" : "integer",
      "exampleValue" : ""
    },
    "useStartTLS" : {
      "title" : "Start TLS",
      "description" : "",
      "propertyOrder" : 900,
      "required" : true,
      "type" : "boolean",
      "exampleValue" : ""
    },
    "bindPassword" : {
```

```
      "title" : "Bind Password",
      "description" : "",
      "propertyOrder" : 500,
      "required" : true,
      "type" : "string",
      "format" : "password",
      "exampleValue" : ""
    },
    "serverUrls" : {
      "title" : "Host Urls",
      "description" : "An ordered list of connection strings for LDAP directories.Each connection
 string is composed as follows: HOST:PORT. serverHostname = Host Name",
      "propertyOrder" : 200,
      "required" : true,
      "items" : {
        "type" : "string"
      },
      "type" : "array",
      "exampleValue" : ""
    },
    "bindDN" : {
      "title" : "Bind DN",
      "description" : "",
      "propertyOrder" : 400,
      "required" : true,
      "type" : "string",
      "exampleValue" : ""
    }
  }
}
```

DataStoreModule

Realm Operations

Resource path: `/realm-config/authentication/modules/datastore`

Resource version: `1.0`

create

Usage:

```
am> create DataStoreModule --realm Realm --id id --body body
```

Parameters:

`--id`

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "authenticationLevel" : {
      "title" : "Authentication Level",
      "description" : "The authentication level associated with this module.<br><br>Each
 authentication module has an authentication level that can be used to indicate the level of security
 associated with the module; 0 is the lowest (and the default).",
      "propertyOrder" : 100,
      "required" : true,
      "type" : "integer",
      "exampleValue" : ""
    }
  }
}
```

delete

Usage:

```
am> delete DataStoreModule --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action DataStoreModule --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action DataStoreModule --realm Realm --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action DataStoreModule --realm Realm --actionName nextdescendents
```

query

Get the full list of instances of this collection. This query only supports `_queryFilter=true` filter.

Usage:

```
am> query DataStoreModule --realm Realm --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read DataStoreModule --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update DataStoreModule --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "authenticationLevel" : {
      "title" : "Authentication Level",
      "description" : "The authentication level associated with this module.<br><br>Each
 authentication module has an authentication level that can be used to indicate the level of security
 associated with the module; 0 is the lowest (and the default).",
      "propertyOrder" : 100,
      "required" : true,
      "type" : "integer",
      "exampleValue" : ""
    }
  }
}
```

Global Operations

Resource path: `/global-config/authentication/modules/datastore`

Resource version: `1.0`

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action DataStoreModule --global --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action DataStoreModule --global --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action DataStoreModule --global --actionName nextdescendents
```

read

Usage:

```
am> read DataStoreModule --global
```

update

Usage:

```
am> update DataStoreModule --global --body body
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "defaults" : {
      "properties" : {
        "authenticationLevel" : {
          "title" : "Authentication Level",
          "description" : "The authentication level associated with this module.<br><br>Each
 authentication module has an authentication level that can be used to indicate the level of security
 associated with the module; 0 is the lowest (and the default).",
          "propertyOrder" : 100,
          "required" : true,
          "type" : "integer",
          "exampleValue" : ""
        }
      },
      "type" : "object",
      "title" : "Realm Defaults"
    }
  }
}
```

DataStoreService

Realm Operations

Resource path: `/realm-config/services/DataStoreService`

Resource version: `1.0`

create

Usage:

```
am> create DataStoreService --realm Realm --body body
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "policyDataStoreId" : {
      "title" : "Policy Data Store",
      "description" : "Select a data store configuration to be used for policy storage",
      "propertyOrder" : 100,
      "required" : true,
      "type" : "string",
      "exampleValue" : ""
    },
    "applicationDataStoreId" : {
      "title" : "Application Data Store",
      "description" : "Select a data store configuration to be used for application storage",
      "propertyOrder" : 200,
      "required" : true,
      "type" : "string",
      "exampleValue" : ""
    }
  }
}
```

delete

Usage:

```
am> delete DataStoreService --realm Realm
```

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action DataStoreService --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action DataStoreService --realm Realm --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action DataStoreService --realm Realm --actionName nextdescendents
```

read

Usage:

```
am> read DataStoreService --realm Realm
```

update

Usage:

```
am> update DataStoreService --realm Realm --body body
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "policyDataStoreId" : {
      "title" : "Policy Data Store",
      "description" : "Select a data store configuration to be used for policy storage",
      "propertyOrder" : 100,
      "required" : true,
      "type" : "string",
      "exampleValue" : ""
    },
    "applicationDataStoreId" : {
      "title" : "Application Data Store",
      "description" : "Select a data store configuration to be used for application storage",
      "propertyOrder" : 200,
      "required" : true,
      "type" : "string",
      "exampleValue" : ""
    }
  }
}
```

Global Operations

Resource path: `/global-config/services/DataStoreService`

Resource version: `1.0`

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action DataStoreService --global --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action DataStoreService --global --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action DataStoreService --global --actionName nextdescendents
```

read

Usage:

```
am> read DataStoreService --global
```

update

Usage:

```
am> update DataStoreService --global --body body
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "defaults" : {
      "properties" : {
        "applicationDataStoreId" : {
          "title" : "Application Data Store",
          "description" : "Select a data store configuration to be used for application storage",
          "propertyOrder" : 200,
          "required" : true,
          "type" : "string",
          "exampleValue" : ""
        },
        "policyDataStoreId" : {
          "title" : "Policy Data Store",
          "description" : "Select a data store configuration to be used for policy storage",
          "propertyOrder" : 100,
          "required" : true,
          "type" : "string",
          "exampleValue" : ""
        }
      },
      "type" : "object",
      "title" : "Realm Defaults"
    }
  }
}
```

DecisionCombiners

Realm Operations

Service for querying and reading decision combiners information. Decision combiners describe how to resolve policy decisions when multiple policies apply

Resource path: `/decisioncombiners`

Resource version: `1.0`

query

Lists all decision combiners

Usage:

```
am> query DecisionCombiners --realm Realm --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all. Fields that can be queried: [title]

read

Reads an individual decision combiner specified by its name

Usage:

```
am> read DecisionCombiners --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

DefaultAdvancedProperties

Global Operations

An object of property key-value pairs

Resource path: `/global-config/servers/server-default/properties/advanced`

Resource version: `1.0`

read

Usage:

```
am> read DefaultAdvancedProperties --global
```

update

Usage:

```
am> update DefaultAdvancedProperties --global --body body
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "patternProperties" : {
    ".+" : {
      "type" : "string",
      "title" : "Value",
      "description" : "Any string value"
    }
  },
  "$schema" : "http://json-schema.org/draft-04/schema#",
  "description" : "An object of property key-value pairs",
  "type" : "object",
  "title" : "Advanced Properties"
}
```

DefaultCtsDataStoreProperties

Global Operations

An object of property key-value pairs

Resource path: `/global-config/servers/server-default/properties/cts`

Resource version: `1.0`

read

Usage:

```
am> read DefaultCtsDataStoreProperties --global
```

update

Usage:

```
am> update DefaultCtsDataStoreProperties --global --body body
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "amconfig.org.forgerock.services.cts.store.common.section" : {
      "title" : "CTS Token Store",
      "type" : "object",
      "propertyOrder" : 0,
```

```
      "properties" : {
        "org.forgerock.services.cts.store.location" : {
          "enum" : [ "default", "external" ],
          "options" : {
            "enum_titles" : [ "Default Token Store", "External Token Store" ]
          },
          "type" : "string",
          "title" : "Store Mode",
          "propertyOrder" : 0,
          "required" : true,

```

DeviceGeofencing

Realm Operations

Resource path: `/realm-config/authentication/authenticationtrees/nodes/DeviceGeoFencingNode`

Resource version: `1.0`

create

Usage:

```
am> create DeviceGeofencing --realm Realm --id id --body body
```

Parameters:

`--id`

The unique identifier for the resource.

`--body`

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "locations" : {
      "title" : "Trusted Locations",
      "description" : "Specify the latitude and longitude of trusted locations. Separate the values
 with a comma; for example, `-123.177201,49.164532`.",
      "propertyOrder" : 100,
      "items" : {
        "type" : "string"
      },
      "minItems" : 1,
      "type" : "array",
      "exampleValue" : ""
    },
    "distance" : {
      "title" : "Geofence Radius (km)",
      "description" : "Specifies the maximum distance, in kilometers, that a device can be from the
 specified trusted location(s).",
      "propertyOrder" : 200,
      "type" : "string",
      "exampleValue" : ""
    }
  },
  "required" : [ "locations", "distance" ]
}
```

delete

Usage:

```
am> delete DeviceGeofencing --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action DeviceGeofencing --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action DeviceGeofencing --realm Realm --actionName getCreatableTypes
```

listOutcomes

List the available outcomes for the node type.

Usage:

```
am> action DeviceGeofencing --realm Realm --body body --actionName listOutcomes
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "title" : "Some configuration of the node. This does not need to be complete against the
 configuration schema."
}
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action DeviceGeofencing --realm Realm --actionName nextdescendents
```

query

Get the full list of instances of this collection. This query only supports `_queryFilter=true` filter.

Usage:

```
am> query DeviceGeofencing --realm Realm --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read DeviceGeofencing --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update DeviceGeofencing --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "locations" : {
      "title" : "Trusted Locations",
      "description" : "Specify the latitude and longitude of trusted locations. Separate the values
 with a comma; for example, `-123.177201,49.164532`.",
      "propertyOrder" : 100,
      "items" : {
        "type" : "string"
      },
      "minItems" : 1,
      "type" : "array",
      "exampleValue" : ""
    },
    "distance" : {
      "title" : "Geofence Radius (km)",
      "description" : "Specifies the maximum distance, in kilometers, that a device can be from the
 specified trusted location(s).",
      "propertyOrder" : 200,
      "type" : "string",
      "exampleValue" : ""
    }
  },
  "required" : [ "locations", "distance" ]
}
```

DeviceIDService

Realm Operations

Resource path: `/realm-config/services/deviceIdService`

Resource version: `1.0`

create

Usage:

```
am> create DeviceIDService --realm Realm --body body
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "deviceIdAttrName" : {
      "title" : "Profile Storage Attribute",
      "description" : "The user's attribute in which to store Device ID profiles.<br><br>The default
 attribute is added to the schema when you prepare a user store for use with OpenAM. If you want to
 use a different attribute, you must make sure to add it to your user store schema prior to enabling
 the Device ID authentication module. OpenAM must be able to write to the attribute.",

      "type" : "string",
      "format" : "password",
      "exampleValue" : ""
    }
  }
}
```

delete

Usage:

```
am> delete DeviceIDService --realm Realm
```

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action DeviceIDService --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action DeviceIDService --realm Realm --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action DeviceIDService --realm Realm --actionName nextdescendents
```

read

Usage:

```
am> read DeviceIDService --realm Realm
```

update

Usage:

```
am> update DeviceIDService --realm Realm --body body
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{

  }
}
```

Global Operations

Resource path: `/global-config/services/deviceIdService`

Resource version: `1.0`

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action DeviceIDService --global --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action DeviceIDService --global --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action DeviceIDService --global --actionName nextdescendents
```

read

Usage:

```
am> read DeviceIDService --global
```

update

Usage:

```
am> update DeviceIDService --global --body body
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "defaults" : {
      "properties" : {
        "deviceIdSettingsEncryptionKeystorePassword" : {
          "title" : "Key Store Password",
          "description" : "Password to unlock the key store. This password is encrypted when it is
 saved in the OpenAM configuration. You should modify the default value.",
          "propertyOrder" : 500,
          "required" : false,

```

DeviceIdMatchModule

Realm Operations

Resource path: `/realm-config/authentication/modules/deviceidmatch`

Resource version: `1.0`

create

Usage:

```
am> create DeviceIdMatchModule --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "serverScript" : {
      "title" : "Server-side Script",
      "description" : "The server-side script to execute.<br><br>This script will be run on
 the server, subsequent to any client script having returned. It can be written in the selected
 language.",
      "propertyOrder" : 300,
      "required" : true,
      "type" : "string",
      "exampleValue" : ""
    },
    "clientScriptEnabled" : {
      "title" : "Client-side Script Enabled",
      "description" : "Enable this setting if the client-side script should be executed.",
      "propertyOrder" : 100,
      "required" : true,
      "type" : "boolean",
      "exampleValue" : ""
    },
    "clientScript" : {
      "title" : "Client-side Script",
      "description" : "The client-side script.",
      "propertyOrder" : 200,
      "required" : true,
      "type" : "string",
      "exampleValue" : ""
    },
    "authenticationLevel" : {
      "title" : "Authentication Level",
      "description" : "The authentication level associated with the authentication module.<br><br>Each
 authentication module has an authentication level that can be used to indicate the level of security
 associated with the module; 0 is the lowest (and the default).",
      "propertyOrder" : 400,
      "required" : true,
      "type" : "integer",
      "exampleValue" : ""
    }
  }
}
```

delete

Usage:

```
am> delete DeviceIdMatchModule --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action DeviceIdMatchModule --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action DeviceIdMatchModule --realm Realm --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action DeviceIdMatchModule --realm Realm --actionName nextdescendents
```

query

Get the full list of instances of this collection. This query only supports `_queryFilter=true` filter.

Usage:

```
am> query DeviceIdMatchModule --realm Realm --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read DeviceIdMatchModule --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update DeviceIdMatchModule --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "serverScript" : {
      "title" : "Server-side Script",
      "description" : "The server-side script to execute.<br><br>This script will be run on
 the server, subsequent to any client script having returned. It can be written in the selected
 language.",
      "propertyOrder" : 300,
      "required" : true,
      "type" : "string",
      "exampleValue" : ""
    },
    "clientScriptEnabled" : {
      "title" : "Client-side Script Enabled",
      "description" : "Enable this setting if the client-side script should be executed.",
      "propertyOrder" : 100,
      "required" : true,
      "type" : "boolean",
      "exampleValue" : ""
    },
    "clientScript" : {
      "title" : "Client-side Script",
      "description" : "The client-side script.",
      "propertyOrder" : 200,
      "required" : true,
      "type" : "string",
      "exampleValue" : ""
    },
    "authenticationLevel" : {
      "title" : "Authentication Level",
      "description" : "The authentication level associated with the authentication module.<br><br>Each
 authentication module has an authentication level that can be used to indicate the level of security
 associated with the module; 0 is the lowest (and the default).",
      "propertyOrder" : 400,
```

```
      "required" : true,
      "type" : "integer",
      "exampleValue" : ""
    }
  }
}
```

Global Operations

Resource path: `/global-config/authentication/modules/deviceidmatch`

Resource version: `1.0`

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action DeviceIdMatchModule --global --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action DeviceIdMatchModule --global --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action DeviceIdMatchModule --global --actionName nextdescendents
```

read

Usage:

```
am> read DeviceIdMatchModule --global
```

update

Usage:

```
am> update DeviceIdMatchModule --global --body body
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "defaults" : {
      "properties" : {

  }
}
```

DeviceIdSaveModule

Realm Operations

Resource path: `/realm-config/authentication/modules/deviceidsave`

Resource version: `1.0`

create

Usage:

```
am> create DeviceIdSaveModule --realm Realm --id id --body body
```

Parameters:

`--id`

The unique identifier for the resource.

`--body`

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "authenticationLevel" : {
      "title" : "Authentication Level",
      "description" : "The authentication level associated with the authentication module.<br><br>Each
 authentication module has an authentication level that can be used to indicate the level of security
 associated with the module; 0 is the lowest (and the default).",
      "propertyOrder" : 300,
      "required" : true,
      "type" : "integer",
      "exampleValue" : ""
    },
    "maxProfilesAllowed" : {
      "title" : "Maximum stored profile quantity",
      "description" : "No more than specified profiles quantity will be stored in user record",
      "propertyOrder" : 200,
      "required" : true,
      "type" : "integer",
      "exampleValue" : ""
    },
    "autoStoreProfiles" : {
      "title" : "Automatically store new profiles",
      "description" : "Select this checkbox to assume user consent to store every new
 profile<br><br>If this checkbox is selected user won't be prompted for storing new profiles. After
 successful OTP confirmation profile will be stored automatically.",
      "propertyOrder" : 100,
      "required" : true,
      "type" : "boolean",
      "exampleValue" : ""
    }
  }
}
```

delete

Usage:

```
am> delete DeviceIdSaveModule --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action DeviceIdSaveModule --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action DeviceIdSaveModule --realm Realm --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action DeviceIdSaveModule --realm Realm --actionName nextdescendents
```

query

Get the full list of instances of this collection. This query only supports `_queryFilter=true` filter.

Usage:

```
am> query DeviceIdSaveModule --realm Realm --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read DeviceIdSaveModule --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update DeviceIdSaveModule --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "authenticationLevel" : {
      "title" : "Authentication Level",
      "description" : "The authentication level associated with the authentication module.<br><br>Each

      "exampleValue" : ""
    }
  }
}
```

Global Operations

Resource path: `/global-config/authentication/modules/deviceidsave`

Resource version: `1.0`

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action DeviceIdSaveModule --global --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action DeviceIdSaveModule --global --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action DeviceIdSaveModule --global --actionName nextdescendents
```

read

Usage:

```
am> read DeviceIdSaveModule --global
```

update

Usage:

```
am> update DeviceIdSaveModule --global --body body
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "defaults" : {
      "properties" : {
        "maxProfilesAllowed" : {

 module.<br><br>Each authentication module has an authentication level that can be used to indicate
 the level of security associated with the module; 0 is the lowest (and the default).",
          "propertyOrder" : 300,
          "required" : true,
          "type" : "integer",
          "exampleValue" : ""
        }
      },
      "type" : "object",
      "title" : "Realm Defaults"
    }
  }
}
```

DeviceLocationMatch

Realm Operations

Resource path: `/realm-config/authentication/authenticationtrees/nodes/DeviceLocationMatchNode`

Resource version: `1.0`

create

Usage:

```
am> create DeviceLocationMatch --realm Realm --id id --body body
```

Parameters:

`--id`

The unique identifier for the resource.

`--body`

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "distance" : {
      "title" : "Maximum Radius (km)",
      "description" : "Specifies the maximum distance, in kilometers, that a device can be from a
 previously saved location.",
      "propertyOrder" : 100,
      "type" : "string",
      "exampleValue" : ""
    }
  },
  "required" : [ "distance" ]
}
```

delete

Usage:

```
am> delete DeviceLocationMatch --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action DeviceLocationMatch --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action DeviceLocationMatch --realm Realm --actionName getCreatableTypes
```

listOutcomes

List the available outcomes for the node type.

Usage:

```
am> action DeviceLocationMatch --realm Realm --body body --actionName listOutcomes
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "title" : "Some configuration of the node. This does not need to be complete against the
 configuration schema."
}
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action DeviceLocationMatch --realm Realm --actionName nextdescendents
```

query

Get the full list of instances of this collection. This query only supports `_queryFilter=true` filter.

Usage:

```
am> query DeviceLocationMatch --realm Realm --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read DeviceLocationMatch --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update DeviceLocationMatch --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "distance" : {
      "title" : "Maximum Radius (km)",
      "description" : "Specifies the maximum distance, in kilometers, that a device can be from a
 previously saved location.",
      "propertyOrder" : 100,
      "type" : "string",
      "exampleValue" : ""
    }
  },
  "required" : [ "distance" ]
}
```

DeviceMatch

Realm Operations

Resource path: `/realm-config/authentication/authenticationtrees/nodes/DeviceMatchNode`

Resource version: `1.0`

create

Usage:

```
am> create DeviceMatch --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "expiration" : {
      "title" : "Expiration",
      "description" : "Specify the number of days until profile expiration. Expired profiles will not
 match.",
      "propertyOrder" : 200,
      "type" : "integer",
      "exampleValue" : ""
    },
    "acceptableVariance" : {
      "title" : "Acceptable Variance",
      "description" : "Specify the maximum amount of device attribute differences that is still
 acceptable for a match.",
      "propertyOrder" : 100,
      "type" : "integer",
      "exampleValue" : ""
    },
    "script" : {
      "title" : "Custom Matching Script",
      "description" : "Decision Node Script",
      "propertyOrder" : 400,
      "type" : "string",
      "exampleValue" : ""
    },
    "useScript" : {
      "title" : "Use Custom Matching Script",
      "description" : "Use a custom script for matching device profiles. When enabled, the Acceptable
 Variance and Expiration properties are ignored. The script's type has to be: Decision Node Script.",
      "propertyOrder" : 300,
      "type" : "boolean",
      "exampleValue" : ""
    }
  },
  "required" : [ "acceptableVariance", "useScript", "script", "expiration" ]
}
```

delete

Usage:

```
am> delete DeviceMatch --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action DeviceMatch --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action DeviceMatch --realm Realm --actionName getCreatableTypes
```

listOutcomes

List the available outcomes for the node type.

Usage:

```
am> action DeviceMatch --realm Realm --body body --actionName listOutcomes
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "title" : "Some configuration of the node. This does not need to be complete against the
 configuration schema."
}
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action DeviceMatch --realm Realm --actionName nextdescendents
```

query

Get the full list of instances of this collection. This query only supports `_queryFilter=true` filter.

Usage:

```
am> query DeviceMatch --realm Realm --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read DeviceMatch --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update DeviceMatch --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "expiration" : {
      "title" : "Expiration",
      "description" : "Specify the number of days until profile expiration. Expired profiles will not
 match.",
      "propertyOrder" : 200,
      "type" : "integer",
      "exampleValue" : ""
    },
    "acceptableVariance" : {
      "title" : "Acceptable Variance",
      "description" : "Specify the maximum amount of device attribute differences that is still
 acceptable for a match.",
      "propertyOrder" : 100,
      "type" : "integer",
      "exampleValue" : ""
```

```
    },
    "script" : {
      "title" : "Custom Matching Script",
      "description" : "Decision Node Script",
      "propertyOrder" : 400,
      "type" : "string",
      "exampleValue" : ""
    },
    "useScript" : {
      "title" : "Use Custom Matching Script",
      "description" : "Use a custom script for matching device profiles. When enabled, the Acceptable
 Variance and Expiration properties are ignored. The script's type has to be: Decision Node Script.",
      "propertyOrder" : 300,
      "type" : "boolean",
      "exampleValue" : ""
    }
  },
  "required" : [ "acceptableVariance", "useScript", "script", "expiration" ]
}
```

DeviceProfile

Realm Operations

The device profile service is responsible for exposing functions to change the collection of User devices. The supported methods are update, delete, query

Resource path: `/users/{user}/devices/profile`

Resource version: `1.0`

delete

Delete user device

Usage:

```
am> delete DeviceProfile --realm Realm --id id --user user
```

Parameters:

`--id`

The unique identifier for the resource.

`--user`

The device profile service is responsible for exposing functions to change the collection of User devices. The supported methods are update, delete, query

query

Query the user devices

Usage:

```
am> query DeviceProfile --realm Realm --filter filter --user user
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all. Fields that can be queried: [*]

--user

The device profile service is responsible for exposing functions to change the collection of User devices. The supported methods are update, delete, query

update

Update an existing user device alias

Usage:

```
am> update DeviceProfile --realm Realm --id id --body body --user user
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "$schema" : "http://json-schema.org/draft-04/schema#",
  "description" : "User devices schema that is used for device profile",
  "type" : "object",
  "title" : "User devices schema",
  "properties" : {
    "identifier" : {
      "type" : "string",
      "title" : "Identifier",
      "description" : "The unique identifier of the device"
    },
    "alias" : {
      "type" : "string",
      "title" : "Device alias name",
      "description" : "The alias name of user device"
```

```
    },
    "lastSelectedDate" : {
      "type" : "string",
      "title" : "Last selected date",
      "description" : "Date when the device was selected last time"
    },
    "metadata" : {
      "type" : "object",
      "title" : "Device Metadata",
      "description" : "The JSON representation of device metadata"
    },
    "location" : {
      "type" : "object",
      "title" : "Device Location",
      "description" : "The current device location",
      "properties" : {
        "longitude" : {
          "type" : "number",
          "title" : "Location latitude",
          "description" : "The location latitude"
        },
        "latitude" : {
          "type" : "number",
          "title" : "Location longitude",
          "description" : "The location longitude"
        }
      }
    }
  }
}
```

--user

The device profile service is responsible for exposing functions to change the collection of User devices. The supported methods are update, delete, query

DeviceProfileCollector

Realm Operations

Resource path: `/realm-config/authentication/authenticationtrees/nodes/DeviceProfileCollectorNode`

Resource version: `1.0`

create

Usage:

```
am> create DeviceProfileCollector --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "deviceMetadata" : {
      "title" : "Collect Device Metadata",
      "description" : "Instructs the client to collect device metadata.",
      "propertyOrder" : 200,
      "type" : "boolean",
      "exampleValue" : ""
    },
    "deviceLocation" : {
      "title" : "Collect Device Location",
      "description" : "Instructs the client to collect device location.",
      "propertyOrder" : 300,
      "type" : "boolean",
      "exampleValue" : ""
    },
    "message" : {
      "title" : "Message",
      "description" : "Optional message to display to the user when capturing device information.
 Enter a locale in the KEY field, for example `en-us`, and the localized message as the VALUE.",
      "propertyOrder" : 400,
      "patternProperties" : {
        ".*" : {
          "type" : "string"
        }
      },
      "type" : "object",
      "exampleValue" : ""
    },
    "maximumSize" : {
      "title" : "Maximum Profile Size (KB)",
      "description" : "Specify the maximum accepted size for a device profile in kilobytes. If the
 returned profile size exceeds this maximum the authentication will fail. Note that larger profiles
 can impact performance.",
      "propertyOrder" : 100,
      "type" : "string",
      "exampleValue" : ""
    }
  },
  "required" : [ "deviceLocation", "deviceMetadata", "message", "maximumSize" ]
}
```

delete

Usage:

```
am> delete DeviceProfileCollector --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action DeviceProfileCollector --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action DeviceProfileCollector --realm Realm --actionName getCreatableTypes
```

listOutcomes

List the available outcomes for the node type.

Usage:

```
am> action DeviceProfileCollector --realm Realm --body body --actionName listOutcomes
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "title" : "Some configuration of the node. This does not need to be complete against the
 configuration schema."
}
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action DeviceProfileCollector --realm Realm --actionName nextdescendents
```

query

Get the full list of instances of this collection. This query only supports `_queryFilter=true` filter.

Usage:

```
am> query DeviceProfileCollector --realm Realm --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read DeviceProfileCollector --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update DeviceProfileCollector --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
```

```
  "properties" : {
    "deviceMetadata" : {
      "title" : "Collect Device Metadata",
      "description" : "Instructs the client to collect device metadata.",
      "propertyOrder" : 200,
      "type" : "boolean",
      "exampleValue" : ""
    },
    "deviceLocation" : {
      "title" : "Collect Device Location",
      "description" : "Instructs the client to collect device location.",
      "propertyOrder" : 300,
      "type" : "boolean",
      "exampleValue" : ""
    },
    "message" : {
      "title" : "Message",
      "description" : "Optional message to display to the user when capturing device information.
 Enter a locale in the KEY field, for example `en-us`, and the localized message as the VALUE.",
      "propertyOrder" : 400,
      "patternProperties" : {
        ".*" : {
          "type" : "string"
        }
      },
      "type" : "object",
      "exampleValue" : ""
    },
    "maximumSize" : {
      "title" : "Maximum Profile Size (KB)",
      "description" : "Specify the maximum accepted size for a device profile in kilobytes. If the
 returned profile size exceeds this maximum the authentication will fail. Note that larger profiles
 can impact performance.",
      "propertyOrder" : 100,
      "type" : "string",
      "exampleValue" : ""
    }
  },
  "required" : [ "deviceLocation", "deviceMetadata", "message", "maximumSize" ]
}
```

DeviceProfileSave

Realm Operations

Resource path: `/realm-config/authentication/authenticationtrees/nodes/DeviceSaveNode`

Resource version: `1.0`

create

Usage:

```
am> create DeviceProfileSave --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "maxSavedProfiles" : {
      "title" : "Maximum Saved Profiles",
      "description" : "Specify the maximum number of device profiles to save in a user's profile. When
 the maximum is reached, saving a new profile replaces the least-recently used profile.",
      "propertyOrder" : 200,
      "type" : "integer",
      "exampleValue" : ""
    },
    "variableName" : {
      "title" : "Device Name Variable",
      "description" : "Specify an existing variable name, in shared state, that contains the value to
 use as this device's name.",
      "propertyOrder" : 100,
      "type" : "string",
      "exampleValue" : ""
    },
    "saveDeviceMetadata" : {
      "title" : "Save Device Metadata",
      "description" : "Specify whether device metadata should be saved.",
      "propertyOrder" : 300,
      "type" : "boolean",
      "exampleValue" : ""
    },
    "saveDeviceLocation" : {
      "title" : "Save Device Location",
      "description" : "Specify whether device location should be saved.",
      "propertyOrder" : 400,
      "type" : "boolean",
      "exampleValue" : ""
    }
  },
  "required" : [ "saveDeviceMetadata", "variableName", "maxSavedProfiles", "saveDeviceLocation" ]
}
```

delete

Usage:

```
am> delete DeviceProfileSave --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action DeviceProfileSave --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action DeviceProfileSave --realm Realm --actionName getCreatableTypes
```

listOutcomes

List the available outcomes for the node type.

Usage:

```
am> action DeviceProfileSave --realm Realm --body body --actionName listOutcomes
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "title" : "Some configuration of the node. This does not need to be complete against the
 configuration schema."
}
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action DeviceProfileSave --realm Realm --actionName nextdescendents
```

query

Get the full list of instances of this collection. This query only supports `_queryFilter=true` filter.

Usage:

```
am> query DeviceProfileSave --realm Realm --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read DeviceProfileSave --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update DeviceProfileSave --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
```

```
  "properties" : {
    "maxSavedProfiles" : {
      "title" : "Maximum Saved Profiles",
      "description" : "Specify the maximum number of device profiles to save in a user's profile. When
 the maximum is reached, saving a new profile replaces the least-recently used profile.",
      "propertyOrder" : 200,
      "type" : "integer",
      "exampleValue" : ""
    },
    "variableName" : {
      "title" : "Device Name Variable",
      "description" : "Specify an existing variable name, in shared state, that contains the value to
 use as this device's name.",
      "propertyOrder" : 100,
      "type" : "string",
      "exampleValue" : ""
    },
    "saveDeviceMetadata" : {
      "title" : "Save Device Metadata",
      "description" : "Specify whether device metadata should be saved.",
      "propertyOrder" : 300,
      "type" : "boolean",
      "exampleValue" : ""
    },
    "saveDeviceLocation" : {
      "title" : "Save Device Location",
      "description" : "Specify whether device location should be saved.",
      "propertyOrder" : 400,
      "type" : "boolean",
      "exampleValue" : ""
    }
  },
  "required" : [ "saveDeviceMetadata", "variableName", "maxSavedProfiles", "saveDeviceLocation" ]
}
```

DeviceProfilesService

Realm Operations

Resource path: `/realm-config/services/deviceProfilesService`

Resource version: `1.0`

create

Usage:

```
am> create DeviceProfilesService --realm Realm --body body
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "deviceProfilesSettingsEncryptionKeystore" : {
      "title" : "Encryption Key Store",
      "description" : "Path to the key store from which to load encryption keys.",
      "propertyOrder" : 300,

      "type" : "string",
      "exampleValue" : ""
    }
  }
}
```

delete

Usage:

```
am> delete DeviceProfilesService --realm Realm
```

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action DeviceProfilesService --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action DeviceProfilesService --realm Realm --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action DeviceProfilesService --realm Realm --actionName nextdescendents
```

read

Usage:

```
am> read DeviceProfilesService --realm Realm
```

update

Usage:

```
am> update DeviceProfilesService --realm Realm --body body
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "deviceProfilesSettingsEncryptionKeystore" : {
      "title" : "Encryption Key Store",

  }
}
```

Global Operations

Resource path: `/global-config/services/deviceProfilesService`

Resource version: `1.0`

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action DeviceProfilesService --global --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action DeviceProfilesService --global --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action DeviceProfilesService --global --actionName nextdescendents
```

read

Usage:

```
am> read DeviceProfilesService --global
```

update

Usage:

```
am> update DeviceProfilesService --global --body body
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "defaults" : {
      "properties" : {
        "deviceProfilesAttrName" : {
          "title" : "Profile Storage Attribute",
          "description" : "The user's attribute in which to store Device profiles.<br><br>The default
 attribute is added to the schema when you prepare a user store for use with OpenAM. If you want to
 use a different attribute, you must make sure to add it to your user store schema prior to enabling
 the Device Profiles authentication module. OpenAM must be able to write to the attribute.",

DeviceTamperingVerification

Realm Operations

Resource path: `/realm-config/authentication/authenticationtrees/nodes/DeviceTamperingVerificationNode`

Resource version: `1.0`

create

Usage:

```
am> create DeviceTamperingVerification --realm Realm --id id --body body
```

Parameters:

`--id`

The unique identifier for the resource.

`--body`

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "score" : {
      "title" : "Score Threshold",
      "description" : "Specifies the score threshold for determining if a device is jailbroken or
 rooted. Jailbreak scores received from the client will be between 0 and 1. The higher the score, the
 more likely the device is jailbroken (Emulators will score a 1).",
      "propertyOrder" : 100,
      "type" : "string",
      "exampleValue" : ""
    }
  },
  "required" : [ "score" ]
}
```

delete

Usage:

```
am> delete DeviceTamperingVerification --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action DeviceTamperingVerification --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action DeviceTamperingVerification --realm Realm --actionName getCreatableTypes
```

listOutcomes

List the available outcomes for the node type.

Usage:

```
am> action DeviceTamperingVerification --realm Realm --body body --actionName listOutcomes
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "title" : "Some configuration of the node. This does not need to be complete against the
 configuration schema."
}
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action DeviceTamperingVerification --realm Realm --actionName nextdescendents
```

query

Get the full list of instances of this collection. This query only supports `_queryFilter=true` filter.

Usage:

```
am> query DeviceTamperingVerification --realm Realm --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read DeviceTamperingVerification --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update DeviceTamperingVerification --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "score" : {
      "title" : "Score Threshold",
      "description" : "Specifies the score threshold for determining if a device is jailbroken or
 rooted. Jailbreak scores received from the client will be between 0 and 1. The higher the score, the
 more likely the device is jailbroken (Emulators will score a 1).",
      "propertyOrder" : 100,
      "type" : "string",
      "exampleValue" : ""
    }
  },
  "required" : [ "score" ]
}
```

DirectoryConfiguration

Global Operations

Connection details for directory server(s).

Resource path: `/global-config/servers/{serverName}/properties/directoryConfiguration`

Resource version: `1.0`

read

Usage:

```
am> read DirectoryConfiguration --global --serverName serverName
```

Parameters:

`--serverName`

Connection details for directory server(s).

update

Usage:

```
am> update DirectoryConfiguration --global --serverName serverName --body body
```

Parameters:

`--serverName`

Connection details for directory server(s).

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "directoryConfiguration" : {
      "type" : "object",
      "title" : "Directory Configuration",
      "propertyOrder" : 0,
      "properties" : {
        "minConnectionPool" : {
          "title" : "Minimum Connection Pool",
          "propertyOrder" : 0,
          "type" : "number"
        },
        "maxConnectionPool" : {
          "title" : "Maximum Connection Pool",
          "propertyOrder" : 1,
          "type" : "number"
        },
        "bindDn" : {
          "title" : "Bind DN",
          "propertyOrder" : 2,
          "type" : "string"
        },
        "bindPassword" : {
          "title" : "Bind Password",
          "propertyOrder" : 3,
          "type" : "string",
          "format" : "password"
        }
      }
    },
    "directoryServers" : {
      "type" : "array",

      "propertyOrder" : 1,
      "items" : {
        "type" : "object",
        "required" : [ "serverName", "hostName", "portNumber", "connectionType" ],
        "properties" : {
          "serverName" : {
            "title" : "Name",
            "type" : "string",
            "propertyOrder" : 0
          },
          "hostName" : {
            "title" : "Host Name",
            "type" : "string",
            "propertyOrder" : 1
          },
          "portNumber" : {
            "title" : "Port Number",
            "type" : "string",
            "propertyOrder" : 2
          },
          "connectionType" : {
```

```
            "type" : "string",
            "enum" : [ "SIMPLE", "SSL" ],
            "options" : {
              "enum_titles" : [ "SIMPLE", "SSL" ]
            },
            "title" : "Connection Type",
            "propertyOrder" : 3
          }
        }
      }
    }
  }
}
```

DisplayUsername

Realm Operations

Resource path: `/realm-config/authentication/authenticationtrees/nodes/DisplayUserNameNode`

Resource version: `1.0`

create

Usage:

```
am> create DisplayUsername --realm Realm --id id --body body
```

Parameters:

`--id`

The unique identifier for the resource.

`--body`

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "userName" : {
      "title" : "User Name",
      "description" : "The attribute used to identify the the user name in IDM.",
      "propertyOrder" : 100,
      "type" : "string",
      "exampleValue" : ""
    },
    "identityAttribute" : {
      "title" : "Identity Attribute",
      "description" : "The attribute used to identify the the object in IDM.",
      "propertyOrder" : 200,
      "type" : "string",
      "exampleValue" : ""
    }
  },
  "required" : [ "identityAttribute", "userName" ]
}
```

delete

Usage:

```
am> delete DisplayUsername --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action DisplayUsername --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action DisplayUsername --realm Realm --actionName getCreatableTypes
```

listOutcomes

List the available outcomes for the node type.

Usage:

```
am> action DisplayUsername --realm Realm --body body --actionName listOutcomes
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "title" : "Some configuration of the node. This does not need to be complete against the
 configuration schema."
}
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action DisplayUsername --realm Realm --actionName nextdescendents
```

query

Get the full list of instances of this collection. This query only supports `_queryFilter=true` filter.

Usage:

```
am> query DisplayUsername --realm Realm --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read DisplayUsername --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update DisplayUsername --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "userName" : {
      "title" : "User Name",
      "description" : "The attribute used to identify the the user name in IDM.",
      "propertyOrder" : 100,
      "type" : "string",
      "exampleValue" : ""
    },
    "identityAttribute" : {
      "title" : "Identity Attribute",
      "description" : "The attribute used to identify the the object in IDM.",
      "propertyOrder" : 200,
      "type" : "string",
      "exampleValue" : ""
    }
  },
  "required" : [ "identityAttribute", "userName" ]
}
```

ElasticSearch

Realm Operations

Resource path: `/realm-config/services/audit/Elasticsearch`

Resource version: `1.0`

create

Usage:

```
am> create ElasticSearch --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "elasticsearchBuffering" : {
      "type" : "object",
      "title" : "Buffering",

        }
      }
    }
  }
}
```

delete

Usage:

```
am> delete ElasticSearch --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action ElasticSearch --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action ElasticSearch --realm Realm --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action ElasticSearch --realm Realm --actionName nextdescendents
```

query

Get the full list of instances of this collection. This query only supports `_queryFilter=true` filter.

Usage:

```
am> query ElasticSearch --realm Realm --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read ElasticSearch --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update ElasticSearch --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "elasticsearchBuffering" : {
      "type" : "object",
      "title" : "Buffering",

          "exampleValue" : ""
        }
      }
    }
  }
}
```

delete

Usage:

```
am> delete ElasticSearch --global --id id
```

Parameters:

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action ElasticSearch --global --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action ElasticSearch --global --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action ElasticSearch --global --actionName nextdescendents
```

query

Get the full list of instances of this collection. This query only supports `_queryFilter=true` filter.

Usage:

```
am> query ElasticSearch --global --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read ElasticSearch --global --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update ElasticSearch --global --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "elasticsearchBuffering" : {
      "type" : "object",

create

Usage:

```
am> create EmailService --realm Realm --body body
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
```

```
 "properties" : {
   "sslState" : {
     "title" : "Mail Server Secure Connection",
     "description" : "Specifies whether to connect to the SMTP mail server using SSL.",
     "propertyOrder" : 600,
     "required" : true,
     "type" : "string",
     "exampleValue" : ""
   },
   "subject" : {
     "title" : "Email Subject",
     "description" : "Specifies a subject for notification messages. If you do not set this, OpenAM
does not set the subject for notification messages.",
     "propertyOrder" : 900,
     "required" : false,
     "type" : "string",
     "exampleValue" : ""
   },
   "emailAddressAttribute" : {
     "title" : "Email Attribute Name",
     "description" : "Specifies the profile attribute from which to retrieve the end user's email
address.",
     "propertyOrder" : 800,
     "required" : true,
     "type" : "string",
     "exampleValue" : ""
   },
   "emailRateLimitSeconds" : {
     "title" : "Email Rate Limit",
     "description" : "Specifies the minimum number of seconds which must elapse between sending
emails to an individual user.",
     "propertyOrder" : 1100,
     "required" : true,
     "type" : "integer",
     "exampleValue" : ""
   },
   "hostname" : {
     "title" : "Mail Server Host Name",
     "description" : "Specifies the fully qualified domain name of the SMTP mail server through which
to send email notifications.",
     "propertyOrder" : 200,
     "required" : true,
     "type" : "string",
     "exampleValue" : "smtp.example.com"
   },
   "from" : {
     "title" : "Email From Address",
     "description" : "Specifies the address from which to send email notifications.",
     "propertyOrder" : 700,
     "required" : true,
     "type" : "string",
     "exampleValue" : "no-reply@example.com"
   },
   "message" : {
     "title" : "Email Content",
     "description" : "Specifies content for notification messages. If you do not set this, OpenAM
includes only the confirmation URL in the mail body.",
     "propertyOrder" : 1000,
     "required" : false,
```

```
      "type" : "string",
      "exampleValue" : ""
    },
    "password" : {
      "title" : "Mail Server Authentication Password",
      "description" : "Specifies the password for the SMTP user name.",
      "propertyOrder" : 500,
      "required" : true,
      "type" : "string",
      "format" : "password",
      "exampleValue" : ""
    },
    "port" : {
      "title" : "Mail Server Host Port",
      "description" : "Specifies the port number for the SMTP mail server.",
      "propertyOrder" : 300,
      "required" : true,
      "type" : "integer",
      "exampleValue" : ""
    },
    "username" : {
      "title" : "Mail Server Authentication Username",
      "description" : "Specifies the user name for the SMTP mail server.",
      "propertyOrder" : 400,
      "required" : true,
      "type" : "string",
      "exampleValue" : "username"
    },
    "emailImplClassName" : {
      "title" : "Email Message Implementation Class",
      "description" : "Specifies the class that sends email notifications, such as those sent for user
 registration and forgotten passwords.",
      "propertyOrder" : 100,
      "required" : true,
      "type" : "string",
      "exampleValue" : ""
    }
  }
}
```

delete

Usage:

```
am> delete EmailService --realm Realm
```

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action EmailService --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action EmailService --realm Realm --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action EmailService --realm Realm --actionName nextdescendents
```

read

Usage:

```
am> read EmailService --realm Realm
```

update

Usage:

```
am> update EmailService --realm Realm --body body
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "sslState" : {
      "title" : "Mail Server Secure Connection",
      "description" : "Specifies whether to connect to the SMTP mail server using SSL.",
      "propertyOrder" : 600,
      "required" : true,
      "type" : "string",
      "exampleValue" : ""
    },
    "subject" : {
      "title" : "Email Subject",
      "description" : "Specifies a subject for notification messages. If you do not set this, OpenAM
 does not set the subject for notification messages.",
      "propertyOrder" : 900,
      "required" : false,
      "type" : "string",
      "exampleValue" : ""
```

```
   },
   "emailAddressAttribute" : {
     "title" : "Email Attribute Name",
     "description" : "Specifies the profile attribute from which to retrieve the end user's email
address.",
     "propertyOrder" : 800,
     "required" : true,
     "type" : "string",
     "exampleValue" : ""
   },
   "emailRateLimitSeconds" : {
     "title" : "Email Rate Limit",
     "description" : "Specifies the minimum number of seconds which must elapse between sending
emails to an individual user.",

      "type" : "string",
      "exampleValue" : "username"
    },
    "emailImplClassName" : {
      "title" : "Email Message Implementation Class",
      "description" : "Specifies the class that sends email notifications, such as those sent for user
 registration and forgotten passwords.",
      "propertyOrder" : 100,
      "required" : true,
      "type" : "string",
      "exampleValue" : ""
    }
  }
}
```

Global Operations

Resource path: `/global-config/services/email`

Resource version: `1.0`

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action EmailService --global --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action EmailService --global --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action EmailService --global --actionName nextdescendents
```

read

Usage:

```
am> read EmailService --global
```

update

Usage:

```
am> update EmailService --global --body body
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "defaults" : {
      "properties" : {
        "password" : {
          "title" : "Mail Server Authentication Password",
          "description" : "Specifies the password for the SMTP user name.",
          "propertyOrder" : 500,
          "required" : true,
          "type" : "string",
          "format" : "password",
          "exampleValue" : ""
        },
        "port" : {
          "title" : "Mail Server Host Port",
          "description" : "Specifies the port number for the SMTP mail server.",

EmailSuspendNode

Realm Operations

Resource path: `/realm-config/authentication/authenticationtrees/nodes/EmailSuspendNode`

Resource version: `1.0`

create

Usage:

```
am> create EmailSuspendNode --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "objectLookup" : {
      "title" : "Object Lookup",
      "description" : "Determines whether object lookup should occur. If true, existing object is
 queried. Otherwise, object in shared state is used for template object.",
      "propertyOrder" : 400,
      "type" : "boolean",
      "exampleValue" : ""
    },
    "emailTemplateName" : {
      "title" : "Email Template Name",
      "description" : "The IDM email template to be sent.",
      "propertyOrder" : 100,
```

```
      "type" : "string",
      "exampleValue" : ""
    },
    "emailAttribute" : {
      "title" : "Email Attribute",
      "description" : "The IDM email field to send the email to.",
      "propertyOrder" : 200,
      "type" : "string",
      "exampleValue" : ""
    },
    "identityAttribute" : {
      "title" : "Identity Attribute",
      "description" : "The attribute used to identify the the object in IDM.",
      "propertyOrder" : 500,
      "type" : "string",
      "exampleValue" : ""
    },
    "emailSuspendMessage" : {
      "title" : "Email Suspend Message",
      "description" : "The localised message to be returned once the tree is suspended.",
      "propertyOrder" : 300,
      "patternProperties" : {
        ".*" : {
          "type" : "string"
        }
      },
      "type" : "object",
      "exampleValue" : ""
    }
  },
  "required" : [ "emailSuspendMessage", "emailTemplateName", "objectLookup", "identityAttribute",
 "emailAttribute" ]
}
```

delete

Usage:

```
am> delete EmailSuspendNode --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action EmailSuspendNode --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action EmailSuspendNode --realm Realm --actionName getCreatableTypes
```

listOutcomes

List the available outcomes for the node type.

Usage:

```
am> action EmailSuspendNode --realm Realm --body body --actionName listOutcomes
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "title" : "Some configuration of the node. This does not need to be complete against the
 configuration schema."
}
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action EmailSuspendNode --realm Realm --actionName nextdescendents
```

query

Get the full list of instances of this collection. This query only supports `_queryFilter=true` filter.

Usage:

```
am> query EmailSuspendNode --realm Realm --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read EmailSuspendNode --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update EmailSuspendNode --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "objectLookup" : {
      "title" : "Object Lookup",
      "description" : "Determines whether object lookup should occur. If true, existing object is
 queried. Otherwise, object in shared state is used for template object.",
      "propertyOrder" : 400,
      "type" : "boolean",
      "exampleValue" : ""
    },
    "emailTemplateName" : {
      "title" : "Email Template Name",
      "description" : "The IDM email template to be sent.",
      "propertyOrder" : 100,
      "type" : "string",
      "exampleValue" : ""
    },
    "emailAttribute" : {
      "title" : "Email Attribute",
      "description" : "The IDM email field to send the email to.",
      "propertyOrder" : 200,
      "type" : "string",
      "exampleValue" : ""
```

```
    },
    "identityAttribute" : {
      "title" : "Identity Attribute",
      "description" : "The attribute used to identify the the object in IDM.",
      "propertyOrder" : 500,
      "type" : "string",
      "exampleValue" : ""
    },
    "emailSuspendMessage" : {
      "title" : "Email Suspend Message",
      "description" : "The localised message to be returned once the tree is suspended.",
      "propertyOrder" : 300,
      "patternProperties" : {
        ".*" : {
          "type" : "string"
        }
      },
      "type" : "object",
      "exampleValue" : ""
    }
  },
  "required" : [ "emailSuspendMessage", "emailTemplateName", "objectLookup", "identityAttribute",
 "emailAttribute" ]
}
```

EmailTemplateNode

Realm Operations

Resource path: `/realm-config/authentication/authenticationtrees/nodes/EmailTemplateNode`

Resource version: `1.0`

create

Usage:

```
am> create EmailTemplateNode --realm Realm --id id --body body
```

Parameters:

`--id`

The unique identifier for the resource.

`--body`

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "emailAttribute" : {
      "title" : "Email Attribute",
      "description" : "The IDM email field to send the email to.",
      "propertyOrder" : 200,
      "type" : "string",
      "exampleValue" : ""
    },
    "identityAttribute" : {
      "title" : "Identity Attribute",
      "description" : "The attribute used to identify the the object in IDM.",
      "propertyOrder" : 300,
      "type" : "string",
      "exampleValue" : ""
    },
    "emailTemplateName" : {
      "title" : "Email Template Name",
      "description" : "The IDM email template to be sent.",
      "propertyOrder" : 100,
      "type" : "string",
      "exampleValue" : ""
    }
  },
  "required" : [ "identityAttribute", "emailAttribute", "emailTemplateName" ]
}
```

delete

Usage:

```
am> delete EmailTemplateNode --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action EmailTemplateNode --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action EmailTemplateNode --realm Realm --actionName getCreatableTypes
```

listOutcomes

List the available outcomes for the node type.

Usage:

```
am> action EmailTemplateNode --realm Realm --body body --actionName listOutcomes
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "title" : "Some configuration of the node. This does not need to be complete against the
 configuration schema."
}
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action EmailTemplateNode --realm Realm --actionName nextdescendents
```

query

Get the full list of instances of this collection. This query only supports `_queryFilter=true` filter.

Usage:

```
am> query EmailTemplateNode --realm Realm --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read EmailTemplateNode --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update EmailTemplateNode --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "emailAttribute" : {
      "title" : "Email Attribute",
      "description" : "The IDM email field to send the email to.",
      "propertyOrder" : 200,
      "type" : "string",
      "exampleValue" : ""
    },
    "identityAttribute" : {
      "title" : "Identity Attribute",
      "description" : "The attribute used to identify the the object in IDM.",
      "propertyOrder" : 300,
      "type" : "string",
      "exampleValue" : ""
    },
    "emailTemplateName" : {
      "title" : "Email Template Name",
      "description" : "The IDM email template to be sent.",
      "propertyOrder" : 100,
      "type" : "string",
      "exampleValue" : ""
    }
  },
  "required" : [ "identityAttribute", "emailAttribute", "emailTemplateName" ]
}
```

EnvironmentAndSystemPropertySecretsStore

Global Operations

Resource path: `/global-config/secrets/stores/EnvironmentAndSystemPropertySecretStore`

Resource version: `1.0`

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action EnvironmentAndSystemPropertySecretsStore --global --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action EnvironmentAndSystemPropertySecretsStore --global --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action EnvironmentAndSystemPropertySecretsStore --global --actionName nextdescendents
```

read

Usage:

```
am> read EnvironmentAndSystemPropertySecretsStore --global
```

update

Usage:

```
am> update EnvironmentAndSystemPropertySecretsStore --global --body body
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "format" : {
      "title" : "Value format",
      "description" : "Indicates the format used to store the secrets. The available options are: <ul>
 <li>Plain text: the secrets are stored as UTF-8 encoded text.</li> <li>Base64 encoded: the secrets
 are stored as Base64 encoded binary values.</li> <li>Encrypted text: the plain text secrets are
 encrypted using AM's encryption key.</li> <li>Encrypted Base64 encoded: the Base64 encoded binary
 values are encrypted using AM's encryption key.</li>  <li>Encrypted HMAC key: the Base64 encoded
 binary representation of the HMAC key is encrypted using AM's encryption key. Use this format when
 working with non generic secrets.</li> <li>Base64 encoded HMAC key: the secrets are binary HMAC keys
 encoded with Base64.</li> <li>Encrypted with Google KMS: the secrets are encrypted using Google's
 Key Management Service.</li> <li>Google KMS-encrypted HMAC key: the secrets are binary HMAC keys that
 have been encrypted with Google's Key Management Service (KMS).</li> </ul>",
      "propertyOrder" : 100,
      "required" : true,
      "type" : "string",
      "exampleValue" : ""
    }
  }
}
```

FailureURL

Realm Operations

Resource path: `/realm-config/authentication/authenticationtrees/nodes/SetFailureUrlNode`

Resource version: `1.0`

create

Usage:

```
am> create FailureURL --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "failureUrl" : {
      "title" : "Failure URL",
      "description" : "",
      "propertyOrder" : 100,
      "type" : "string",
      "exampleValue" : ""
    }
  },
  "required" : [ "failureUrl" ]
}
```

delete

Usage:

```
am> delete FailureURL --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action FailureURL --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action FailureURL --realm Realm --actionName getCreatableTypes
```

listOutcomes

List the available outcomes for the node type.

Usage:

```
am> action FailureURL --realm Realm --body body --actionName listOutcomes
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "title" : "Some configuration of the node. This does not need to be complete against the
 configuration schema."
}
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action FailureURL --realm Realm --actionName nextdescendents
```

query

Get the full list of instances of this collection. This query only supports `_queryFilter=true` filter.

Usage:

```
am> query FailureURL --realm Realm --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read FailureURL --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update FailureURL --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "failureUrl" : {
      "title" : "Failure URL",
      "description" : "",
      "propertyOrder" : 100,
      "type" : "string",
      "exampleValue" : ""
    }
  },
  "required" : [ "failureUrl" ]
}
```

FederationModule

Realm Operations

Resource path: `/realm-config/authentication/modules/federation`

Resource version: `1.0`

create

Usage:

```
am> create FederationModule --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "authenticationLevel" : {
      "title" : "Authentication Level",
      "description" : "The authentication level associated with this module.<br><br>Each
 authentication module has an authentication level that can be used to indicate the level of security
 associated with the module; 0 is the lowest (and the default).",
      "propertyOrder" : 100,
      "required" : true,
      "type" : "integer",
      "exampleValue" : ""
    }
  }
}
```

delete

Usage:

```
am> delete FederationModule --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action FederationModule --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action FederationModule --realm Realm --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action FederationModule --realm Realm --actionName nextdescendents
```

query

Get the full list of instances of this collection. This query only supports `_queryFilter=true` filter.

Usage:

```
am> query FederationModule --realm Realm --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read FederationModule --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update FederationModule --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "authenticationLevel" : {
      "title" : "Authentication Level",
      "description" : "The authentication level associated with this module.<br><br>Each
 authentication module has an authentication level that can be used to indicate the level of security
 associated with the module; 0 is the lowest (and the default).",
      "propertyOrder" : 100,
      "required" : true,
      "type" : "integer",
      "exampleValue" : ""
    }
  }
}
```

Global Operations

Resource path: `/global-config/authentication/modules/federation`

Resource version: `1.0`

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action FederationModule --global --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action FederationModule --global --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action FederationModule --global --actionName nextdescendents
```

read

Usage:

```
am> read FederationModule --global
```

update

Usage:

```
am> update FederationModule --global --body body
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "defaults" : {
      "properties" : {
        "authenticationLevel" : {
          "title" : "Authentication Level",
          "description" : "The authentication level associated with this module.<br><br>Each
 authentication module has an authentication level that can be used to indicate the level of security
 associated with the module; 0 is the lowest (and the default).",
          "propertyOrder" : 100,
          "required" : true,
          "type" : "integer",
          "exampleValue" : ""
        }
      },
      "type" : "object",
      "title" : "Realm Defaults"
    }
  }
}
```

FileSystemSecretStore

Realm Operations

Resource path: `/realm-config/secrets/stores/FileSystemSecretStore`

Resource version: `1.0`

create

Usage:

```
am> create FileSystemSecretStore --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "directory" : {
      "title" : "Directory",
      "description" : "The directory containing secret files.",
      "propertyOrder" : 100,
      "required" : true,
      "type" : "string",
      "exampleValue" : ""
    },
    "suffix" : {
      "title" : "File suffix",
      "description" : "A suffix to add to the name of each secret to obtain the file name, such as
 \".txt\" (defaults to no suffix).",
      "propertyOrder" : 200,
      "required" : false,
      "type" : "string",
      "exampleValue" : ""
    },
    "format" : {
      "title" : "File format",
      "description" : "Indicates what format is used to store the secrets in the files. The available
 options are: <ul> <li>Plain text: the secrets are stored as UTF-8 encoded text.</li> <li>Base64
 encoded: the secrets are stored as Base64 encoded binary values.</li> <li>Encrypted text: the plain
 text secrets are encrypted using AM's encryption key.</li> <li>Encrypted Base64 encoded: the Base64
 encoded binary values are encrypted using AM's encryption key.</li>  <li>Encrypted HMAC key: the
 Base64 encoded binary representation of the HMAC key is encrypted using AM's encryption key. Use
 this format when working with non generic secrets.</li> <li>Base64 encoded HMAC key: the secrets are
 binary HMAC keys encoded with Base64.</li> <li>Encrypted with Google KMS: the secrets are encrypted
 using Google's Key Management Service.</li> <li>Google KMS-encrypted HMAC key: the secrets are binary
 HMAC keys that have been encrypted with Google's Key Management Service (KMS).</li> </ul>",
      "propertyOrder" : 300,
      "required" : true,
      "type" : "string",
      "exampleValue" : ""
    }
  }
}
```

delete

Usage:

```
am> delete FileSystemSecretStore --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action FileSystemSecretStore --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action FileSystemSecretStore --realm Realm --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action FileSystemSecretStore --realm Realm --actionName nextdescendents
```

query

Get the full list of instances of this collection. This query only supports `_queryFilter=true` filter.

Usage:

```
am> query FileSystemSecretStore --realm Realm --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read FileSystemSecretStore --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update FileSystemSecretStore --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "directory" : {
      "title" : "Directory",
      "description" : "The directory containing secret files.",
      "propertyOrder" : 100,
      "required" : true,
      "type" : "string",
      "exampleValue" : ""
    },
    "suffix" : {
      "title" : "File suffix",
      "description" : "A suffix to add to the name of each secret to obtain the file name, such as
 \".txt\" (defaults to no suffix).",
      "propertyOrder" : 200,
      "required" : false,
      "type" : "string",
      "exampleValue" : ""
    },
    "format" : {
      "title" : "File format",
      "description" : "Indicates what format is used to store the secrets in the files. The available
 options are: <ul> <li>Plain text: the secrets are stored as UTF-8 encoded text.</li> <li>Base64

 HMAC keys that have been encrypted with Google's Key Management Service (KMS).</li> </ul>",
      "propertyOrder" : 300,
      "required" : true,
      "type" : "string",
      "exampleValue" : ""
    }
  }
}
```

Global Operations

Resource path: `/global-config/secrets/stores/FileSystemSecretStore`

Resource version: `1.0`

create

Usage:

```
am> create FileSystemSecretStore --global --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "directory" : {
      "title" : "Directory",
      "description" : "The directory containing secret files.",
      "propertyOrder" : 100,
      "required" : true,
      "type" : "string",
      "exampleValue" : ""
    },
    "suffix" : {
      "title" : "File suffix",
      "description" : "A suffix to add to the name of each secret to obtain the file name, such as
 \".txt\" (defaults to no suffix).",
      "propertyOrder" : 200,
      "required" : false,
      "type" : "string",
      "exampleValue" : ""
    },
    "format" : {
      "title" : "File format",
      "description" : "Indicates what format is used to store the secrets in the files. The available
 options are: <ul> <li>Plain text: the secrets are stored as UTF-8 encoded text.</li> <li>Base64

 Base64 encoded binary representation of the HMAC key is encrypted using AM's encryption key. Use
 this format when working with non generic secrets.</li> <li>Base64 encoded HMAC key: the secrets are
 binary HMAC keys encoded with Base64.</li> <li>Encrypted with Google KMS: the secrets are encrypted
 using Google's Key Management Service.</li> <li>Google KMS-encrypted HMAC key: the secrets are binary
 HMAC keys that have been encrypted with Google's Key Management Service (KMS).</li> </ul>",
      "propertyOrder" : 300,
      "required" : true,
      "type" : "string",
      "exampleValue" : ""
    }
  }
}
```

delete

Usage:

```
am> delete FileSystemSecretStore --global --id id
```

Parameters:

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action FileSystemSecretStore --global --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action FileSystemSecretStore --global --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action FileSystemSecretStore --global --actionName nextdescendents
```

query

Get the full list of instances of this collection. This query only supports `_queryFilter=true` filter.

Usage:

```
am> query FileSystemSecretStore --global --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read FileSystemSecretStore --global --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update FileSystemSecretStore --global --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "directory" : {
      "title" : "Directory",
      "description" : "The directory containing secret files.",
      "propertyOrder" : 100,
      "required" : true,
      "type" : "string",
      "exampleValue" : ""
    },
    "suffix" : {
      "title" : "File suffix",
      "description" : "A suffix to add to the name of each secret to obtain the file name, such as
 \".txt\" (defaults to no suffix).",
      "propertyOrder" : 200,
      "required" : false,
      "type" : "string",
      "exampleValue" : ""
    },
    "format" : {
      "title" : "File format",
      "description" : "Indicates what format is used to store the secrets in the files. The available

  }
}
```

delete

Usage:

```
am> delete ForgeRockIAMDirectoryServer --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action ForgeRockIAMDirectoryServer --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action ForgeRockIAMDirectoryServer --realm Realm --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action ForgeRockIAMDirectoryServer --realm Realm --actionName nextdescendents
```

query

Get the full list of instances of this collection. This query only supports `_queryFilter=true` filter.

Usage:

```
am> query ForgeRockIAMDirectoryServer --realm Realm --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read ForgeRockIAMDirectoryServer --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update ForgeRockIAMDirectoryServer --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```

}
```

ForgottenPassword

Realm Operations

Self Service endpoint for retrieving a forgotten password

Resource path: `/selfservice/forgottenPassword`

Resource version: `1.0`

read

Initialise the forgotten password reclamation process.A set of requirements will be returned that will need to be fulfilled and sent to the submitRequirements action.

Usage:

```
am> read ForgottenPassword --realm Realm
```

submitRequirements

Submit some fulfilled requirements. Returns either a completion status, or a token along with some more requirements. If requirements are returned, they should be submitted with the token as a fresh request to this action.

Usage:

```
am> action ForgottenPassword --realm Realm --body body --actionName submitRequirements
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "$schema" : "http://json-schema.org/draft-04/schema#",
  "description" : "The structure of a request to the submitRequirements action.",
  "type" : "object",
  "title" : "Submit requirements structure",
  "properties" : {
    "token" : {
      "type" : "string",
      "title" : "Token",
      "description" : "The token returned from the previous submitRequirements request."
    },
    "input" : {
      "type" : "object",
      "title" : "Input",
      "description" : "The input as collected from the user that has forgotten their password. This
 object must conform to the JSON Schema of the requirements property from the last response.",
      "patternProperties" : {
        ".*" : {
          "type" : "any",
          "title" : "Input Property",
          "description" : "Valid content according to the received JSON Schema."
        }
      }
    }
  },
  "required" : [ "input" ]
}
```

ForgottenUsername

Realm Operations

Self Service endpoint for retrieving a forgotten username

Resource path: `/selfservice/forgottenUsername`

Resource version: `1.0`

read

Initialise the forgotten username reclamation process.A set of requirements will be returned that will need to be fulfilled and sent to the submitRequirements action.

Usage:

```
am> read ForgottenUsername --realm Realm
```

submitRequirements

Submit some fulfilled requirements. Returns either a completion status, or a token along with some more requirements. If requirements are returned, they should be submitted with the token as a fresh request to this action.

Usage:

```
am> action ForgottenUsername --realm Realm --body body --actionName submitRequirements
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "$schema" : "http://json-schema.org/draft-04/schema#",
  "description" : "The structure of a request to the submitRequirements action.",
  "type" : "object",
  "title" : "Submit requirements structure",
  "properties" : {
    "token" : {
      "type" : "string",
      "title" : "Token",
      "description" : "The token returned from the previous submitRequirements request."
    },
    "input" : {
      "type" : "object",
      "title" : "Input",
      "description" : "The input as collected from the user that has forgotten their username. This
 object must conform to the JSON Schema of the requirements property from the last response.",
      "patternProperties" : {
        ".*" : {
          "type" : "any",
          "title" : "Input Property",
          "description" : "Valid content according to the received JSON Schema."
        }
      }
    }
  },
  "required" : [ "input" ]
}
```

GeneralProperties

Global Operations

An object of property key-value pairs

Resource path: `/global-config/servers/{serverName}/properties/general`

Resource version: `1.0`

read

Usage:

```
am> read GeneralProperties --global --serverName serverName
```

Parameters:

--serverName

An object of property key-value pairs

update

Usage:

```
am> update GeneralProperties --global --serverName serverName --body body
```

Parameters:

--serverName

An object of property key-value pairs

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "amconfig.header.site" : {

GenericLDAPv3

Realm Operations

Resource path: `/realm-config/services/id-repositories/LDAPv3`

Resource version: `1.0`

create

Usage:

```
am> create GenericLDAPv3 --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "groupconfig" : {
      "type" : "object",
      "title" : "Group Configuration",
      "propertyOrder" : 5,
      "properties" : {
        "sun-idrepo-ldapv3-config-group-attributes" : {
          "title" : "LDAP Groups Attributes",

  }
}
```

delete

Usage:

```
am> delete GenericLDAPv3 --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action GenericLDAPv3 --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action GenericLDAPv3 --realm Realm --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action GenericLDAPv3 --realm Realm --actionName nextdescendents
```

query

Get the full list of instances of this collection. This query only supports `_queryFilter=true` filter.

Usage:

```
am> query GenericLDAPv3 --realm Realm --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read GenericLDAPv3 --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update GenericLDAPv3 --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```

```

GetSessionData

Realm Operations

Resource path: `/realm-config/authentication/authenticationtrees/nodes/SessionDataNode`

Resource version: `1.0`

create

Usage:

```
am> create GetSessionData --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "sessionDataKey" : {
      "title" : "Session Data Key",
      "description" : "",
      "propertyOrder" : 100,
      "type" : "string",
      "exampleValue" : ""
    },
    "sharedStateKey" : {
      "title" : "Shared State Key",
      "description" : "",
      "propertyOrder" : 200,
      "type" : "string",
      "exampleValue" : ""
    }
  },
  "required" : [ "sessionDataKey", "sharedStateKey" ]
}
```

delete

Usage:

```
am> delete GetSessionData --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action GetSessionData --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action GetSessionData --realm Realm --actionName getCreatableTypes
```

listOutcomes

List the available outcomes for the node type.

Usage:

```
am> action GetSessionData --realm Realm --body body --actionName listOutcomes
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "title" : "Some configuration of the node. This does not need to be complete against the
 configuration schema."
}
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action GetSessionData --realm Realm --actionName nextdescendents
```

query

Get the full list of instances of this collection. This query only supports `_queryFilter=true` filter.

Usage:

```
am> query GetSessionData --realm Realm --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read GetSessionData --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update GetSessionData --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "sessionDataKey" : {
      "title" : "Session Data Key",
      "description" : "",
      "propertyOrder" : 100,
      "type" : "string",
      "exampleValue" : ""
    },
    "sharedStateKey" : {
      "title" : "Shared State Key",
      "description" : "",
      "propertyOrder" : 200,
      "type" : "string",
      "exampleValue" : ""
    }
  },
  "required" : [ "sessionDataKey", "sharedStateKey" ]
}
```

GlobalScripts

Global Operations

Resource path: `/global-config/services/scripting/globalScript`

Resource version: `1.0`

create

Usage:

```
am> create GlobalScripts --global --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "script" : {
      "title" : "Script",
      "description" : "The source code of the script. The source code is in UTF-8 format and encoded

      "exampleValue" : ""
    }
  }
}
```

delete

Usage:

```
am> delete GlobalScripts --global --id id
```

Parameters:

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action GlobalScripts --global --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action GlobalScripts --global --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action GlobalScripts --global --actionName nextdescendents
```

query

Get the full list of instances of this collection. This query only supports `_queryFilter=true` filter.

Usage:

```
am> query GlobalScripts --global --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read GlobalScripts --global --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update GlobalScripts --global --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "script" : {
      "title" : "Script",
      "description" : "The source code of the script. The source code is in UTF-8 format and encoded
 into Base64",
      "propertyOrder" : null,
      "required" : true,
      "type" : "string",
      "exampleValue" : ""
    },
    "context" : {
      "title" : "Script type",
      "description" : "The script type. Supported values are: POLICY_CONDITION : Policy Condition
 AUTHENTICATION_SERVER_SIDE : Server-side Authentication  AUTHENTICATION_CLIENT_SIDE : Client-side
 Authentication - Note Client-side scripts must be written in JavaScript OIDC_CLAIMS : OIDC Claims
 SOCIAL_IDP_PROFILE_TRANSFORMATION : Social Identity Provider Profile Transformation",
      "propertyOrder" : null,
      "required" : true,
      "type" : "string",
      "exampleValue" : ""
    },
    "lastModifiedDate" : {
      "title" : "Last modification date",
```

```
     "description" : "A string containing the last modified date and time, in ISO 8601 format. If
the script has not been modified since it was created, this property will have the same value as
creationDate",

     "type" : "string",
     "exampleValue" : ""
   }
```

```
  }
}
```

GlobalSecretsSettings

Global Operations

Resource path: `/global-config/secrets/GlobalSecrets`

Resource version: `1.0`

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action GlobalSecretsSettings --global --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action GlobalSecretsSettings --global --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action GlobalSecretsSettings --global --actionName nextdescendents
```

read

Usage:

```
am> read GlobalSecretsSettings --global
```

update

Usage:

```
am> update GlobalSecretsSettings --global --body body
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "storeTypes" : {
      "title" : "Store types",
      "description" : "This setting contains the currently installed secrets store types.",
      "propertyOrder" : 100,
      "required" : true,
      "items" : {
        "type" : "string"
      },
      "type" : "array",
      "exampleValue" : ""
    }
  }
}
```

Globalization

Realm Operations

Resource path: `/realm-config/services/globalization`

Resource version: `1.0`

create

Usage:

```
am> create Globalization --realm Realm --body body
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "commonNameFormats" : {
      "title" : "Auto Generated Common Name Format",
      "description" : "Use this list to configure how OpenAM formats names shown in the console
 banner.<br><br>This setting allows the name of the authenticated user shown in the OpenAM console
 banner to be customised based on the locale of the user.",
      "propertyOrder" : 300,
      "required" : true,
      "items" : {
        "type" : "string"
      },
      "type" : "array",
      "exampleValue" : ""
    }
  }
}
```

delete

Usage:

```
am> delete Globalization --realm Realm
```

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action Globalization --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action Globalization --realm Realm --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action Globalization --realm Realm --actionName nextdescendents
```

read

Usage:

```
am> read Globalization --realm Realm
```

update

Usage:

```
am> update Globalization --realm Realm --body body
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "commonNameFormats" : {
      "title" : "Auto Generated Common Name Format",
      "description" : "Use this list to configure how OpenAM formats names shown in the console
 banner.<br><br>This setting allows the name of the authenticated user shown in the OpenAM console
 banner to be customised based on the locale of the user.",
      "propertyOrder" : 300,
      "required" : true,
      "items" : {
        "type" : "string"
      },
      "type" : "array",
      "exampleValue" : ""
    }
  }
}
```

Global Operations

Resource path: `/global-config/services/globalization`

Resource version: `1.0`

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action Globalization --global --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action Globalization --global --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action Globalization --global --actionName nextdescendents
```

read

Usage:

```
am> read Globalization --global
```

update

Usage:

```
am> update Globalization --global --body body
```

Parameters:

      "required" : true,
      "type" : "integer",
      "exampleValue" : ""
```

```
    }
  }
}
```

delete

Usage:

```
am> delete GoogleKeyManagementServiceSecretStore --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action GoogleKeyManagementServiceSecretStore --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action GoogleKeyManagementServiceSecretStore --realm Realm --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action GoogleKeyManagementServiceSecretStore --realm Realm --actionName nextdescendents
```

query

Get the full list of instances of this collection. This query only supports `_queryFilter=true` filter.

Usage:

```
am> query GoogleKeyManagementServiceSecretStore --realm Realm --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read GoogleKeyManagementServiceSecretStore --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update GoogleKeyManagementServiceSecretStore --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "project" : {
      "title" : "Project",
      "description" : "The GCP project that contains the key ring",

    }
  }
}
```

delete

Usage:

```
am> delete GoogleKeyManagementServiceSecretStore --global --id id
```

Parameters:

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action GoogleKeyManagementServiceSecretStore --global --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action GoogleKeyManagementServiceSecretStore --global --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action GoogleKeyManagementServiceSecretStore --global --actionName nextdescendents
```

query

Get the full list of instances of this collection. This query only supports `_queryFilter=true` filter.

Usage:

```
am> query GoogleKeyManagementServiceSecretStore --global --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read GoogleKeyManagementServiceSecretStore --global --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update GoogleKeyManagementServiceSecretStore --global --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "publicKeyCacheMaxSize" : {
      "title" : "Public key cache size",
      "description" : "The maximum number of public keys to cache. The cache is per-server.",

      "required" : true,
      "items" : {
        "type" : "string",
        "minLength" : 1
      },
      "minItems" : 1,
      "uniqueItems" : true,
      "type" : "array",
      "exampleValue" : ""
    }
  }
}
```

delete

Usage:

```
am> delete GoogleKmsMappings --realm Realm --
GoogleKeyManagementServiceSecretStore GoogleKeyManagementServiceSecretStore --id id
```

Parameters:

--GoogleKeyManagementServiceSecretStore

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action GoogleKmsMappings --realm Realm --
GoogleKeyManagementServiceSecretStore GoogleKeyManagementServiceSecretStore --actionName getAllTypes
```

Parameters:

--GoogleKeyManagementServiceSecretStore

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action GoogleKmsMappings --realm Realm --
GoogleKeyManagementServiceSecretStore GoogleKeyManagementServiceSecretStore --actionName getCreatableTypes
```

Parameters:

--GoogleKeyManagementServiceSecretStore

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action GoogleKmsMappings --realm Realm --
GoogleKeyManagementServiceSecretStore GoogleKeyManagementServiceSecretStore --actionName nextdescendents
```

Parameters:

--GoogleKeyManagementServiceSecretStore

query

Get the full list of instances of this collection. This query only supports `_queryFilter=true` filter.

Usage:

```
am> query GoogleKmsMappings --realm Realm --filter filter --
GoogleKeyManagementServiceSecretStore GoogleKeyManagementServiceSecretStore
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

--GoogleKeyManagementServiceSecretStore

read

Usage:

```
am> read GoogleKmsMappings --realm Realm --
GoogleKeyManagementServiceSecretStore GoogleKeyManagementServiceSecretStore --id id
```

Parameters:

--GoogleKeyManagementServiceSecretStore

--id

The unique identifier for the resource.

update

Usage:

```
am> update GoogleKmsMappings --realm Realm --
GoogleKeyManagementServiceSecretStore GoogleKeyManagementServiceSecretStore --id id --body body
```

Parameters:

--GoogleKeyManagementServiceSecretStore

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "secretId" : {
      "title" : "Secret ID",
      "description" : "The secret ID that is to be associated with an alias.",
      "propertyOrder" : 100,
      "required" : true,
      "type" : "string",
      "exampleValue" : ""
    },
    "aliases" : {
      "title" : "Key Name",
      "description" : "The name of the KMS key to use for this purpose. The key must exist in the
 configured key ring.",
      "propertyOrder" : 200,
      "required" : true,
      "items" : {
        "type" : "string",
        "minLength" : 1
      },
      "minItems" : 1,
      "uniqueItems" : true,
      "type" : "array",
      "exampleValue" : ""
    }
  }
}
```

Global Operations

Resource path: `/global-config/secrets/stores/GoogleKeyManagementServiceSecretStore/{GoogleKeyManagementServiceSecretStore}/mappings`

Resource version: `1.0`

create

Usage:

```
am> create GoogleKmsMappings --global --
GoogleKeyManagementServiceSecretStore GoogleKeyManagementServiceSecretStore --id id --body body
```

Parameters:

--GoogleKeyManagementServiceSecretStore

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "aliases" : {
      "title" : "Key Name",
      "description" : "The name of the KMS key to use for this purpose. The key must exist in the
 configured key ring.",
      "propertyOrder" : 200,
      "required" : true,
      "items" : {
        "type" : "string",
        "minLength" : 1
      },
      "minItems" : 1,
      "uniqueItems" : true,
      "type" : "array",
      "exampleValue" : ""
    },
    "secretId" : {
      "title" : "Secret ID",
      "description" : "The secret ID that is to be associated with an alias.",
      "propertyOrder" : 100,
      "required" : true,
      "type" : "string",
      "exampleValue" : ""
    }
  }
}
```

delete

Usage:

```
am> delete GoogleKmsMappings --global --
GoogleKeyManagementServiceSecretStore GoogleKeyManagementServiceSecretStore --id id
```

Parameters:

--GoogleKeyManagementServiceSecretStore

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action GoogleKmsMappings --global --
GoogleKeyManagementServiceSecretStore GoogleKeyManagementServiceSecretStore --actionName getAllTypes
```

Parameters:

--GoogleKeyManagementServiceSecretStore

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action GoogleKmsMappings --global --
GoogleKeyManagementServiceSecretStore GoogleKeyManagementServiceSecretStore --actionName getCreatableTypes
```

Parameters:

--GoogleKeyManagementServiceSecretStore

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action GoogleKmsMappings --global --
GoogleKeyManagementServiceSecretStore GoogleKeyManagementServiceSecretStore --actionName nextdescendents
```

Parameters:

--GoogleKeyManagementServiceSecretStore

query

Get the full list of instances of this collection. This query only supports `_queryFilter=true` filter.

Usage:

```
am> query GoogleKmsMappings --global --filter filter --
GoogleKeyManagementServiceSecretStore GoogleKeyManagementServiceSecretStore
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

--GoogleKeyManagementServiceSecretStore

read

Usage:

```
am> read GoogleKmsMappings --global --
GoogleKeyManagementServiceSecretStore GoogleKeyManagementServiceSecretStore --id id
```

Parameters:

--GoogleKeyManagementServiceSecretStore

--id

The unique identifier for the resource.

update

Usage:

```
am> update GoogleKmsMappings --global --
GoogleKeyManagementServiceSecretStore GoogleKeyManagementServiceSecretStore --id id --body body
```

Parameters:

--GoogleKeyManagementServiceSecretStore

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "aliases" : {
      "title" : "Key Name",
      "description" : "The name of the KMS key to use for this purpose. The key must exist in the
 configured key ring.",
      "propertyOrder" : 200,
      "required" : true,
      "items" : {
        "type" : "string",
        "minLength" : 1
      },
      "minItems" : 1,
      "uniqueItems" : true,
      "type" : "array",
      "exampleValue" : ""
    },
    "secretId" : {
      "title" : "Secret ID",
      "description" : "The secret ID that is to be associated with an alias.",
      "propertyOrder" : 100,
      "required" : true,
      "type" : "string",
      "exampleValue" : ""
    }
  }
}
```

GraphiteReporter

Global Operations

Resource path: `/global-config/services/monitoring/graphite`

Resource version: `1.0`

create

Usage:

```
am> create GraphiteReporter --global --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "port" : {
      "title" : "Port",
      "description" : "The port of the Graphite server to which metrics should be published.",
      "propertyOrder" : 200,
      "required" : true,
      "type" : "integer",
      "exampleValue" : ""
    },
    "frequency" : {
      "title" : "Frequency",
      "description" : "The frequency (in seconds) at which metrics should be published.",
      "propertyOrder" : 300,
      "required" : true,
      "type" : "integer",
      "exampleValue" : ""
    },
    "host" : {
      "title" : "Hostname",
      "description" : "The hostname of the Graphite server to which metrics should be published.",
      "propertyOrder" : 100,
      "required" : true,
      "type" : "string",
      "exampleValue" : ""
    }
  }
}
```

delete

Usage:

```
am> delete GraphiteReporter --global --id id
```

Parameters:

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action GraphiteReporter --global --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action GraphiteReporter --global --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action GraphiteReporter --global --actionName nextdescendents
```

query

Get the full list of instances of this collection. This query only supports `_queryFilter=true` filter.

Usage:

```
am> query GraphiteReporter --global --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read GraphiteReporter --global --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update GraphiteReporter --global --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "port" : {
      "title" : "Port",
      "description" : "The port of the Graphite server to which metrics should be published.",
      "propertyOrder" : 200,
      "required" : true,
      "type" : "integer",
      "exampleValue" : ""
    },
    "frequency" : {
      "title" : "Frequency",
      "description" : "The frequency (in seconds) at which metrics should be published.",
      "propertyOrder" : 300,
      "required" : true,
      "type" : "integer",
      "exampleValue" : ""
    },
    "host" : {
      "title" : "Hostname",
      "description" : "The hostname of the Graphite server to which metrics should be published.",
      "propertyOrder" : 100,
      "required" : true,
      "type" : "string",
      "exampleValue" : ""
    }
  }
}
```

HOTPGenerator

Realm Operations

Resource path: `/realm-config/authentication/authenticationtrees/nodes/OneTimePasswordGeneratorNode`

Resource version: `1.0`

create

Usage:

```
am> create HOTPGenerator --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "length" : {
      "title" : "One Time Password Length",
      "description" : "The length in characters of the one time password.",
      "propertyOrder" : 100,
      "type" : "integer",
      "exampleValue" : ""
    }
  },
  "required" : [ "length" ]
}
```

delete

Usage:

```
am> delete HOTPGenerator --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action HOTPGenerator --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action HOTPGenerator --realm Realm --actionName getCreatableTypes
```

listOutcomes

List the available outcomes for the node type.

Usage:

```
am> action HOTPGenerator --realm Realm --body body --actionName listOutcomes
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "title" : "Some configuration of the node. This does not need to be complete against the
 configuration schema."
}
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action HOTPGenerator --realm Realm --actionName nextdescendents
```

query

Get the full list of instances of this collection. This query only supports `_queryFilter=true` filter.

Usage:

```
am> query HOTPGenerator --realm Realm --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read HOTPGenerator --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update HOTPGenerator --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "length" : {
      "title" : "One Time Password Length",
      "description" : "The length in characters of the one time password.",
      "propertyOrder" : 100,
      "type" : "integer",
      "exampleValue" : ""
    }
  },
  "required" : [ "length" ]
}
```

HostedSaml2EntityProvider

Realm Operations

Allows the management of hosted SAML2 entity providers.

Resource path: `/realm-config/saml2/hosted`

Resource version: `1.0`

create

create.description

Usage:

```
am> create HostedSaml2EntityProvider --realm Realm --body body
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "$schema" : "http://json-schema.org/draft-07/schema#",
  "ignoredProperties" : [ "_id", "_rev" ],
  "description" : "This schema describes a hosted SAML2 entity provider.",
  "title" : "SAML2 Hosted Entity Provider",
  "type" : "object",
  "properties" : {
    "entityId" : {
      "type" : "string"
    },
    "identityProvider" : {
      "title" : "Identity Provider",
      "description" : "This schema describes a SAML2 identity provider.",
      "type" : "object",
      "traverseObject" : true,
      "properties" : {
        "assertionContent" : {
          "propertyOrder" : 0,
          "title" : "Assertion Content",
          "type" : "object",
          "traverseObject" : true,
          "properties" : {
            "signingAndEncryption" : {
              "traverseObject" : true,
              "title" : "Signing And Encryption",
              "type" : "object",
              "properties" : {
                "requestResponseSigning" : {
                  "traverseObject" : true,
                  "title" : "Request/Response Signing",
                  "description" : "Select the checkbox for each request/response that should be
 signed",

```

delete

Removes the SAML2 entity provider from the configuration including all of its associated roles.

Usage:

```
am> delete HostedSaml2EntityProvider --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

read

Returns the roles of the SAML2 entity provider.

Usage:

```
am> read HostedSaml2EntityProvider --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Updates details of the SAML2 entity provider role.

Usage:

```
am> update HostedSaml2EntityProvider --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "$schema" : "http://json-schema.org/draft-07/schema#",

The mapping should be defined as [NameFormatURI|]SAML ATTRIBUTE NAME=PROFILE ATTRIBUTE NAME in
assertion. Example: EmailAddress=mail, Address=postaladdress, urn:oasis:names:tc:SAML:2.0:attrname-
```

```
format:uri|urn:mace:dir:attribute-def:cn=cn The mapper also allows for static values to be defined.
 To define a static value, enclose the profile attribute name in double quotes. Example: partnerID=
\"staticPartnerIDValue\", urn:oasis:names:tc:SAML:2.0:attrname-format:uri|nameID=\"staticNameIDValue
\". To flag an attribute as being a binary value and have its value Base64 encoded, add ;binary to the
 end of the profile attribute name. Example: photo=photo;binary, urn:oasis:names:tc:SAML:2.0:attrname-
format:uri|photo=photo;binary",

HotpModule

Realm Operations

Resource path: `/realm-config/authentication/modules/hotp`

Resource version: `1.0`

create

Usage:

```
am> create HotpModule --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "otpLength" : {
      "title" : "One Time Password Length ",
      "description" : "The length of the generated One Time Password (in digits)",
      "propertyOrder" : 1000,

    "mobileCarrierAttribute" : {
      "title" : "Mobile Carrier Attribute Name",
      "description" : "This is the attribute name used for a mobile carrier domain for sending SMS
 messages",
      "propertyOrder" : 1300,
      "required" : true,
      "type" : "string",
      "exampleValue" : ""
    },
    "smtpUserPassword" : {
      "title" : "Mail Server Authentication Password",
      "description" : "The password to use if the mail server is using SMTP authentication",
      "propertyOrder" : 600,
      "required" : true,
      "type" : "string",
      "format" : "password",
      "exampleValue" : ""
    }
  }
}
```

delete

Usage:

```
am> delete HotpModule --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action HotpModule --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action HotpModule --realm Realm --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action HotpModule --realm Realm --actionName nextdescendents
```

query

Get the full list of instances of this collection. This query only supports `_queryFilter=true` filter.

Usage:

```
am> query HotpModule --realm Realm --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read HotpModule --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update HotpModule --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "otpLength" : {
      "title" : "One Time Password Length ",

}
```

Global Operations

Resource path: `/global-config/authentication/modules/hotp`

Resource version: `1.0`

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action HotpModule --global --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action HotpModule --global --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action HotpModule --global --actionName nextdescendents
```

read

Usage:

```
am> read HotpModule --global
```

update

Usage:

```
am> update HotpModule --global --body body
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "defaults" : {
      "properties" : {
        "smtpUserPassword" : {

}
```

HsmMappings

Realm Operations

Resource path: `/realm-config/secrets/stores/HsmSecretStore/{HsmSecretStore}/mappings`

Resource version: `1.0`

create

Usage:

```
am> create HsmMappings --realm Realm --HsmSecretStore HsmSecretStore --id id --body body
```

Parameters:

--HsmSecretStore

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "aliases" : {
      "title" : "Aliases",
      "description" : "The list of keystore aliases that can resolve the secret. The first element of
 the alias list determines which alias is the \"active\" one. Active secrets are used for signature
 generation and encryption, while the non-active secrets are mainly used for signature verification
 and decryption.",
      "propertyOrder" : 200,
      "required" : true,
      "items" : {
        "type" : "string",
        "minLength" : 1
      },
      "minItems" : 1,
      "uniqueItems" : true,
      "type" : "array",
      "exampleValue" : ""
    },
    "secretId" : {
      "title" : "Secret ID",
      "description" : "The secret ID that is to be associated with an alias.",
      "propertyOrder" : 100,
      "required" : true,
      "type" : "string",
      "exampleValue" : ""
    }
  }
}
```

delete

Usage:

```
am> delete HsmMappings --realm Realm --HsmSecretStore HsmSecretStore --id id
```

Parameters:

--HsmSecretStore

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action HsmMappings --realm Realm --HsmSecretStore HsmSecretStore --actionName getAllTypes
```

Parameters:

--HsmSecretStore

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action HsmMappings --realm Realm --HsmSecretStore HsmSecretStore --actionName getCreatableTypes
```

Parameters:

--HsmSecretStore

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action HsmMappings --realm Realm --HsmSecretStore HsmSecretStore --actionName nextdescendents
```

Parameters:

--HsmSecretStore

query

Get the full list of instances of this collection. This query only supports `_queryFilter=true` filter.

Usage:

```
am> query HsmMappings --realm Realm --filter filter --HsmSecretStore HsmSecretStore
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

--HsmSecretStore

read

Usage:

```
am> read HsmMappings --realm Realm --HsmSecretStore HsmSecretStore --id id
```

Parameters:

--HsmSecretStore

--id

The unique identifier for the resource.

update

Usage:

```
am> update HsmMappings --realm Realm --HsmSecretStore HsmSecretStore --id id --body body
```

Parameters:

--HsmSecretStore

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "aliases" : {
      "title" : "Aliases",
      "description" : "The list of keystore aliases that can resolve the secret. The first element of
 the alias list determines which alias is the \"active\" one. Active secrets are used for signature
 generation and encryption, while the non-active secrets are mainly used for signature verification
 and decryption.",
      "propertyOrder" : 200,
      "required" : true,
      "items" : {
        "type" : "string",
        "minLength" : 1
      },
      "minItems" : 1,
      "uniqueItems" : true,
      "type" : "array",
      "exampleValue" : ""
    },
    "secretId" : {
      "title" : "Secret ID",
      "description" : "The secret ID that is to be associated with an alias.",
      "propertyOrder" : 100,
      "required" : true,
      "type" : "string",
      "exampleValue" : ""
    }
  }
}
```

Global Operations

Resource path: `/global-config/secrets/stores/HsmSecretStore/{HsmSecretStore}/mappings`

Resource version: `1.0`

create

Usage:

```
am> create HsmMappings --global --HsmSecretStore HsmSecretStore --id id --body body
```

Parameters:

--HsmSecretStore

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "secretId" : {
      "title" : "Secret ID",
      "description" : "The secret ID that is to be associated with an alias.",
      "propertyOrder" : 100,
      "required" : true,
      "type" : "string",
      "exampleValue" : ""
    },
    "aliases" : {
      "title" : "Aliases",
      "description" : "The list of keystore aliases that can resolve the secret. The first element of
 the alias list determines which alias is the \"active\" one. Active secrets are used for signature
 generation and encryption, while the non-active secrets are mainly used for signature verification
 and decryption.",
      "propertyOrder" : 200,
      "required" : true,
      "items" : {
        "type" : "string",
        "minLength" : 1
      },
      "minItems" : 1,
      "uniqueItems" : true,
      "type" : "array",
      "exampleValue" : ""
    }
  }
}
```

delete

Usage:

```
am> delete HsmMappings --global --HsmSecretStore HsmSecretStore --id id
```

Parameters:

--HsmSecretStore

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action HsmMappings --global --HsmSecretStore HsmSecretStore --actionName getAllTypes
```

Parameters:

--HsmSecretStore

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action HsmMappings --global --HsmSecretStore HsmSecretStore --actionName getCreatableTypes
```

Parameters:

--HsmSecretStore

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action HsmMappings --global --HsmSecretStore HsmSecretStore --actionName nextdescendents
```

Parameters:

--HsmSecretStore

query

Get the full list of instances of this collection. This query only supports `_queryFilter=true` filter.

Usage:

```
am> query HsmMappings --global --filter filter --HsmSecretStore HsmSecretStore
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

--HsmSecretStore

read

Usage:

```
am> read HsmMappings --global --HsmSecretStore HsmSecretStore --id id
```

Parameters:

--HsmSecretStore

--id

The unique identifier for the resource.

update

Usage:

```
am> update HsmMappings --global --HsmSecretStore HsmSecretStore --id id --body body
```

Parameters:

--HsmSecretStore

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "secretId" : {
      "title" : "Secret ID",
      "description" : "The secret ID that is to be associated with an alias.",
      "propertyOrder" : 100,
      "required" : true,
      "type" : "string",
      "exampleValue" : ""
    },
    "aliases" : {
      "title" : "Aliases",
      "description" : "The list of keystore aliases that can resolve the secret. The first element of
 the alias list determines which alias is the \"active\" one. Active secrets are used for signature
 generation and encryption, while the non-active secrets are mainly used for signature verification
 and decryption.",

HsmSecretStore

Realm Operations

Resource path: `/realm-config/secrets/stores/HsmSecretStore`

Resource version: `1.0`

create

Usage:

```
am> create HsmSecretStore --realm Realm --id id --body body
```

Parameters:

`--id`

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "storePassword" : {
      "title" : "HSM PIN/password secret ID",
      "description" : "The secret ID using which the HSM's PIN/password can be obtained. This secret
 ID will be resolved using one of the other secret stores configured.<br> It must not start or end
 with the <code>.</code> character. <br>The <code>.</code> character must not be followed by another
 <code>.</code> character.<br>Must contain <code>a-z</code>, <code>A-Z</code>, <code>0-9</code> and
 <code>.</code> characters only.",
      "propertyOrder" : 300,
      "required" : true,
      "type" : "string",
      "exampleValue" : ""
    },
    "providerGuiceKey" : {
      "title" : "Provider Guice Key Name",
      "description" : "The name of a Guice key that can be used to obtain an initialised provider from
 which the HSM keystore can be obtained.",
      "propertyOrder" : 200,
      "required" : false,
      "type" : "string",
      "exampleValue" : ""
    },
    "leaseExpiryDuration" : {
      "title" : "Key lease expiry",
      "description" : "The amount of minutes a key can be cached from the keystore before it needs to
 be reloaded.",
      "propertyOrder" : 400,
      "required" : true,
      "type" : "integer",
      "exampleValue" : ""
    },
    "file" : {
      "title" : "Configuration File",
      "description" : "The file containing initialisation configuration for the HSM.",
      "propertyOrder" : 100,
      "required" : false,
      "type" : "string",
      "exampleValue" : ""
    }
  }
}
```

delete

Usage:

```
am> delete HsmSecretStore --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action HsmSecretStore --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action HsmSecretStore --realm Realm --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action HsmSecretStore --realm Realm --actionName nextdescendents
```

query

Get the full list of instances of this collection. This query only supports `_queryFilter=true` filter.

Usage:

```
am> query HsmSecretStore --realm Realm --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read HsmSecretStore --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update HsmSecretStore --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "storePassword" : {
      "title" : "HSM PIN/password secret ID",
      "description" : "The secret ID using which the HSM's PIN/password can be obtained. This secret
 ID will be resolved using one of the other secret stores configured.<br> It must not start or end
 with the <code>.</code> character. <br>The <code>.</code> character must not be followed by another
 <code>.</code> character.<br>Must contain <code>a-z</code>, <code>A-Z</code>, <code>0-9</code> and
 <code>.</code> characters only.",
      "propertyOrder" : 300,
      "required" : true,
      "type" : "string",
      "exampleValue" : ""
    },
    "providerGuiceKey" : {
      "title" : "Provider Guice Key Name",
      "description" : "The name of a Guice key that can be used to obtain an initialised provider from
 which the HSM keystore can be obtained.",
      "propertyOrder" : 200,
      "required" : false,
      "type" : "string",
      "exampleValue" : ""
    },
    "leaseExpiryDuration" : {
      "title" : "Key lease expiry",
      "description" : "The amount of minutes a key can be cached from the keystore before it needs to
 be reloaded.",
      "propertyOrder" : 400,
      "required" : true,
      "type" : "integer",
      "exampleValue" : ""
```

```
    },
    "file" : {
      "title" : "Configuration File",
      "description" : "The file containing initialisation configuration for the HSM.",
      "propertyOrder" : 100,
      "required" : false,
      "type" : "string",
      "exampleValue" : ""
    }
  }
}
```

Global Operations

Resource path: `/global-config/secrets/stores/HsmSecretStore`

Resource version: `1.0`

create

Usage:

```
am> create HsmSecretStore --global --id id --body body
```

Parameters:

`--id`

The unique identifier for the resource.

`--body`

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "leaseExpiryDuration" : {
      "title" : "Key lease expiry",
      "description" : "The amount of minutes a key can be cached from the keystore before it needs to
 be reloaded.",
      "propertyOrder" : 400,
      "required" : true,
      "type" : "integer",
      "exampleValue" : ""
    },
    "file" : {
      "title" : "Configuration File",
      "description" : "The file containing initialisation configuration for the HSM.",
      "propertyOrder" : 100,
      "required" : false,
      "type" : "string",
```

```
      "exampleValue" : ""
    },
    "providerGuiceKey" : {
      "title" : "Provider Guice Key Name",
      "description" : "The name of a Guice key that can be used to obtain an initialised provider from
 which the HSM keystore can be obtained.",
      "propertyOrder" : 200,
      "required" : false,
      "type" : "string",
      "exampleValue" : ""
    },
    "storePassword" : {
      "title" : "HSM PIN/password secret ID",
      "description" : "The secret ID using which the HSM's PIN/password can be obtained. This secret
 ID will be resolved using one of the other secret stores configured.<br> It must not start or end
 with the <code>.</code> character. <br>The <code>.</code> character must not be followed by another
 <code>.</code> character.<br>Must contain <code>a-z</code>, <code>A-Z</code>, <code>0-9</code> and
 <code>.</code> characters only.",
      "propertyOrder" : 300,
      "required" : true,
      "type" : "string",
      "exampleValue" : ""
    }
  }
}
```

delete

Usage:

```
am> delete HsmSecretStore --global --id id
```

Parameters:

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action HsmSecretStore --global --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action HsmSecretStore --global --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action HsmSecretStore --global --actionName nextdescendents
```

query

Get the full list of instances of this collection. This query only supports `_queryFilter=true` filter.

Usage:

```
am> query HsmSecretStore --global --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read HsmSecretStore --global --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update HsmSecretStore --global --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "leaseExpiryDuration" : {
      "title" : "Key lease expiry",
      "description" : "The amount of minutes a key can be cached from the keystore before it needs to
 be reloaded.",
      "propertyOrder" : 400,
      "required" : true,
      "type" : "integer",
      "exampleValue" : ""
    },
    "file" : {
      "title" : "Configuration File",
      "description" : "The file containing initialisation configuration for the HSM.",

    },
    "storePassword" : {
      "title" : "HSM PIN/password secret ID",
      "description" : "The secret ID using which the HSM's PIN/password can be obtained. This secret
 ID will be resolved using one of the other secret stores configured.<br> It must not start or end
 with the <code>.</code> character. <br>The <code>.</code> character must not be followed by another
 <code>.</code> character.<br>Must contain <code>a-z</code>, <code>A-Z</code>, <code>0-9</code> and
 <code>.</code> characters only.",
      "propertyOrder" : 300,
      "required" : true,
      "type" : "string",
      "exampleValue" : ""
    }
  }
}
```

HttpBasicModule

Realm Operations

Resource path: `/realm-config/authentication/modules/httpbasic`

Resource version: `1.0`

create

Usage:

```
am> create HttpBasicModule --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "backendModuleName" : {
      "title" : "Backend Module Name",
      "description" : "The name of the module that will be used to perform the
 authentication<br><br>The HTTP Basic authentication module collect the credentials from the user and
 will then supply said credentials to the backend authentication module using the shared state. ",
      "propertyOrder" : 100,
      "required" : true,
      "type" : "string",
      "exampleValue" : ""
    },
    "authenticationLevel" : {
      "title" : "Authentication Level",
      "description" : "The authentication level associated with this module.<br><br>Each
 authentication module has an authentication level that can be used to indicate the level of security
 associated with the module; 0 is the lowest (and the default). ",
      "propertyOrder" : 200,
      "required" : true,
      "type" : "integer",
      "exampleValue" : ""
    }
  }
}
```

delete

Usage:

```
am> delete HttpBasicModule --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action HttpBasicModule --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action HttpBasicModule --realm Realm --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action HttpBasicModule --realm Realm --actionName nextdescendents
```

query

Get the full list of instances of this collection. This query only supports `_queryFilter=true` filter.

Usage:

```
am> query HttpBasicModule --realm Realm --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read HttpBasicModule --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update HttpBasicModule --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "backendModuleName" : {
      "title" : "Backend Module Name",
      "description" : "The name of the module that will be used to perform the
 authentication<br><br>The HTTP Basic authentication module collect the credentials from the user and
 will then supply said credentials to the backend authentication module using the shared state. ",
      "propertyOrder" : 100,
      "required" : true,
      "type" : "string",
      "exampleValue" : ""
    },
    "authenticationLevel" : {
      "title" : "Authentication Level",
      "description" : "The authentication level associated with this module.<br><br>Each

      "type" : "integer",
      "exampleValue" : ""
    }
  }
}
```

Global Operations

Resource path: `/global-config/authentication/modules/httpbasic`

Resource version: `1.0`

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action HttpBasicModule --global --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action HttpBasicModule --global --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action HttpBasicModule --global --actionName nextdescendents
```

read

Usage:

```
am> read HttpBasicModule --global
```

update

Usage:

```
am> update HttpBasicModule --global --body body
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "defaults" : {
      "properties" : {
        "backendModuleName" : {

    }
  }
}
```

IdRepository

Realm Operations

Resource path: `/realm-config/services/id-repositories`

Resource version: `1.0`

create

Usage:

```
am> create IdRepository --realm Realm --body body
```

Parameters:

`--body`

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "sunIdRepoAttributeValidator" : {
      "title" : "Attribute Validator Plug-in",
      "description" : "",
      "propertyOrder" : 300,
      "required" : true,
      "items" : {
        "type" : "string"
      },
      "type" : "array",
      "exampleValue" : ""
    },
    "sunIdRepoAttributeCombiner" : {
      "title" : "Attribute Combiner plug-in",
      "description" : "",
      "propertyOrder" : 100,
      "required" : true,
      "type" : "string",
      "exampleValue" : ""
    }
  }
}
```

delete

Usage:

```
am> delete IdRepository --realm Realm
```

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action IdRepository --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action IdRepository --realm Realm --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action IdRepository --realm Realm --actionName nextdescendents
```

read

Usage:

```
am> read IdRepository --realm Realm
```

update

Usage:

```
am> update IdRepository --realm Realm --body body
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "sunIdRepoAttributeValidator" : {
      "title" : "Attribute Validator Plug-in",
      "description" : "",
      "propertyOrder" : 300,
      "required" : true,
      "items" : {
        "type" : "string"
      },
      "type" : "array",
      "exampleValue" : ""
    },
    "sunIdRepoAttributeCombiner" : {
      "title" : "Attribute Combiner plug-in",
      "description" : "",
      "propertyOrder" : 100,
      "required" : true,
      "type" : "string",
      "exampleValue" : ""
    }
  }
}
```

Global Operations

Resource path: `/global-config/services/id-repositories`

Resource version: `1.0`

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action IdRepository --global --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action IdRepository --global --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action IdRepository --global --actionName nextdescendents
```

read

Usage:

```
am> read IdRepository --global
```

update

Usage:

```
am> update IdRepository --global --body body
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "defaults" : {
      "properties" : {
        "sunIdRepoAttributeCombiner" : {
          "title" : "Attribute Combiner plug-in",
          "description" : "",
          "propertyOrder" : 100,
          "required" : true,
          "type" : "string",
          "exampleValue" : ""
        },
        "sunIdRepoAttributeValidator" : {
          "title" : "Attribute Validator Plug-in",
          "description" : "",
          "propertyOrder" : 300,
          "required" : true,
          "items" : {
            "type" : "string"
          },
          "type" : "array",
          "exampleValue" : ""
        }
      },
      "type" : "object",
      "title" : "Realm Defaults"
    }
  }
}
```

IdRepositoryUser

Global Operations

Resource path: `/global-config/services/id-repositories/user`

Resource version: `1.0`

create

Usage:

```
am> create IdRepositoryUser --global --id id --body body
```

Parameters:

`--id`

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "userPassword" : {
      "title" : "Password",

      "exampleValue" : ""
    }
  }
}
```

delete

Usage:

```
am> delete IdRepositoryUser --global --id id
```

Parameters:

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action IdRepositoryUser --global --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action IdRepositoryUser --global --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action IdRepositoryUser --global --actionName nextdescendents
```

query

Get the full list of instances of this collection. This query only supports `_queryFilter=true` filter.

Usage:

```
am> query IdRepositoryUser --global --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read IdRepositoryUser --global --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update IdRepositoryUser --global --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "userPassword" : {
      "title" : "Password",
      "description" : "",
      "propertyOrder" : 9400,
      "required" : true,
      "type" : "string",
      "format" : "password",
      "exampleValue" : ""
    },
    "telephoneNumber" : {
      "title" : "Telephone Number",
      "description" : "",
      "propertyOrder" : 9700,

```

IdentifyExistingUser

Realm Operations

Resource path: `/realm-config/authentication/authenticationtrees/nodes/IdentifyExistingUserNode`

Resource version: `1.0`

create

Usage:

```
am> create IdentifyExistingUser --realm Realm --id id --body body
```

Parameters:

`--id`

The unique identifier for the resource.

`--body`

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "identifier" : {
      "title" : "Identifier",
      "description" : "The IDM attribute used to save existing value in sharedState for log in
 purposes.",
      "propertyOrder" : 100,
      "type" : "string",
      "exampleValue" : ""
    },
    "identityAttribute" : {
      "title" : "Identity Attribute",
      "description" : "The attribute used to retrieve an existing user.",
      "propertyOrder" : 200,
      "type" : "string",
      "exampleValue" : ""
    }
  },
  "required" : [ "identifier", "identityAttribute" ]
}
```

delete

Usage:

```
am> delete IdentifyExistingUser --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action IdentifyExistingUser --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action IdentifyExistingUser --realm Realm --actionName getCreatableTypes
```

listOutcomes

List the available outcomes for the node type.

Usage:

```
am> action IdentifyExistingUser --realm Realm --body body --actionName listOutcomes
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "title" : "Some configuration of the node. This does not need to be complete against the
 configuration schema."
}
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action IdentifyExistingUser --realm Realm --actionName nextdescendents
```

query

Get the full list of instances of this collection. This query only supports `_queryFilter=true` filter.

Usage:

```
am> query IdentifyExistingUser --realm Realm --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read IdentifyExistingUser --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update IdentifyExistingUser --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "identifier" : {
      "title" : "Identifier",
      "description" : "The IDM attribute used to save existing value in sharedState for log in
 purposes.",
      "propertyOrder" : 100,
      "type" : "string",
      "exampleValue" : ""
    },
    "identityAttribute" : {
      "title" : "Identity Attribute",
      "description" : "The attribute used to retrieve an existing user.",
      "propertyOrder" : 200,
      "type" : "string",
      "exampleValue" : ""
    }
  },
  "required" : [ "identifier", "identityAttribute" ]
}
```

IdentityGatewayAgentGroups

Realm Operations

Agent Groups handler that is responsible for managing agent groups

Resource path: `/realm-config/agents/groups/IdentityGatewayAgent`

Resource version: `1.0`

create

Usage:

```
am> create IdentityGatewayAgentGroups --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
```

```
  "type" : "object",
  "properties" : {
    "status" : {
      "title" : "Status",

    }
  }
}
```

delete

Usage:

```
am> delete IdentityGatewayAgentGroups --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action IdentityGatewayAgentGroups --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action IdentityGatewayAgentGroups --realm Realm --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action IdentityGatewayAgentGroups --realm Realm --actionName nextdescendents
```

query

Querying the agent groups of a specific type

Usage:

```
am> query IdentityGatewayAgentGroups --realm Realm --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read IdentityGatewayAgentGroups --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update IdentityGatewayAgentGroups --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "status" : {
      "title" : "Status",

    }
  }
}
```

delete

Usage:

```
am> delete IdentityGatewayAgents --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action IdentityGatewayAgents --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action IdentityGatewayAgents --realm Realm --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action IdentityGatewayAgents --realm Realm --actionName nextdescendents
```

query

Querying the agents of a specific type

Usage:

```
am> query IdentityGatewayAgents --realm Realm --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read IdentityGatewayAgents --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update IdentityGatewayAgents --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "status" : {
      "title" : "Status",
      "description" : "Status of the agent configuration.",

}
```

IncrementLoginCount

Realm Operations

Resource path: `/realm-config/authentication/authenticationtrees/nodes/IncrementLoginCountNode`

Resource version: `1.0`

create

Usage:

```
am> create IncrementLoginCount --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "identityAttribute" : {
      "title" : "Identity Attribute",
      "description" : "The attribute of the IDM object to use retrieve the object.",
      "propertyOrder" : 100,
      "type" : "string",
      "exampleValue" : ""
    }
  },
  "required" : [ "identityAttribute" ]
}
```

delete

Usage:

```
am> delete IncrementLoginCount --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action IncrementLoginCount --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action IncrementLoginCount --realm Realm --actionName getCreatableTypes
```

listOutcomes

List the available outcomes for the node type.

Usage:

```
am> action IncrementLoginCount --realm Realm --body body --actionName listOutcomes
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "title" : "Some configuration of the node. This does not need to be complete against the
 configuration schema."
}
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action IncrementLoginCount --realm Realm --actionName nextdescendents
```

query

Get the full list of instances of this collection. This query only supports `_queryFilter=true` filter.

Usage:

```
am> query IncrementLoginCount --realm Realm --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read IncrementLoginCount --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update IncrementLoginCount --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "identityAttribute" : {
      "title" : "Identity Attribute",
      "description" : "The attribute of the IDM object to use retrieve the object.",
      "propertyOrder" : 100,
      "type" : "string",
      "exampleValue" : ""
    }
  },
  "required" : [ "identityAttribute" ]
}
```

InnerTreeEvaluator

Realm Operations

Resource path: `/realm-config/authentication/authenticationtrees/nodes/InnerTreeEvaluatorNode`

Resource version: `1.0`

create

Usage:

```
am> create InnerTreeEvaluator --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "tree" : {
      "title" : "Tree Name",
      "description" : "The name of the tree that will be evaluated.",
      "propertyOrder" : 100,
      "type" : "string",
      "exampleValue" : ""
    }
  },
  "required" : [ "tree" ]
}
```

delete

Usage:

```
am> delete InnerTreeEvaluator --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action InnerTreeEvaluator --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action InnerTreeEvaluator --realm Realm --actionName getCreatableTypes
```

listOutcomes

List the available outcomes for the node type.

Usage:

```
am> action InnerTreeEvaluator --realm Realm --body body --actionName listOutcomes
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "title" : "Some configuration of the node. This does not need to be complete against the
 configuration schema."
}
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action InnerTreeEvaluator --realm Realm --actionName nextdescendents
```

query

Get the full list of instances of this collection. This query only supports `_queryFilter=true` filter.

Usage:

```
am> query InnerTreeEvaluator --realm Realm --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read InnerTreeEvaluator --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update InnerTreeEvaluator --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "tree" : {
      "title" : "Tree Name",
      "description" : "The name of the tree that will be evaluated.",
      "propertyOrder" : 100,
      "type" : "string",
      "exampleValue" : ""
    }
  },
  "required" : [ "tree" ]
}
```

IoTService

Realm Operations

Resource path: `/realm-config/services/iot`

Resource version: `1.0`

create

Usage:

```
am> create IoTService --realm Realm --body body
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "oauthJwtIssuerName" : {
      "title" : "OAuth 2.0 JWT Issuer Name",
      "description" : "The name of the Trusted JWT Issuer used by the IoT Service to request access
 tokens for things.",
      "propertyOrder" : 40,
      "required" : true,
      "type" : "string",
      "exampleValue" : ""
    },

      "items" : {
        "type" : "string"
      },
      "type" : "array",
      "exampleValue" : ""
    },
    "createOAuthClient" : {
      "title" : "Create OAuth 2.0 Client",
      "description" : "Create an OAuth 2.0 Client with the given name and default configuration
 required to serve as the client for the IoT Service. The client will be created without any
 scope(s).",
      "propertyOrder" : 10,
      "required" : true,
      "type" : "boolean",
```

```
      "exampleValue" : ""
    },
    "createOAuthJwtIssuer" : {
      "title" : "Create OAuth 2.0 JWT Issuer",
      "description" : "Create a Trusted JWT Issuer with the given name and default configuration
 required for the IoT Service to act as the Issuer when handling request for thing access tokens.",
      "propertyOrder" : 30,
      "required" : true,
      "type" : "boolean",
      "exampleValue" : ""
    },
    "oauthClientName" : {
      "title" : "OAuth 2.0 Client Name",
      "description" : "The name of the default OAuth 2.0 Client used by the IoT Service to request
 access tokens for things.",
      "propertyOrder" : 20,
      "required" : true,
      "type" : "string",
      "exampleValue" : ""
    }
  }
}
```

delete

Usage:

```
am> delete IoTService --realm Realm
```

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action IoTService --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action IoTService --realm Realm --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action IoTService --realm Realm --actionName nextdescendents
```

read

Usage:

```
am> read IoTService --realm Realm
```

update

Usage:

```
am> update IoTService --realm Realm --body body
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "oauthJwtIssuerName" : {
      "title" : "OAuth 2.0 JWT Issuer Name",

}
```

J2EEAgentGroups

Realm Operations

Agent Groups handler that is responsible for managing agent groups

Resource path: `/realm-config/agents/groups/J2EEAgent`

Resource version: `1.0`

create

Usage:

```
am> create J2EEAgentGroups --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "applicationJ2EEAgentConfig" : {
      "type" : "object",
      "title" : "Application",
      "propertyOrder" : 1,

}
```

delete

Usage:

```
am> delete J2EEAgentGroups --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action J2EEAgentGroups --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action J2EEAgentGroups --realm Realm --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action J2EEAgentGroups --realm Realm --actionName nextdescendents
```

query

Querying the agent groups of a specific type

Usage:

```
am> query J2EEAgentGroups --realm Realm --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read J2EEAgentGroups --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update J2EEAgentGroups --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "applicationJ2EEAgentConfig" : {

J2eeAgents

Realm Operations

Agents handler that is responsible for managing agents

Resource path: `/realm-config/agents/J2EEAgent`

Resource version: `1.0`

create

Usage:

```
am> create J2eeAgents --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "ssoJ2EEAgentConfig" : {
      "type" : "object",

    }
  }
}
```

delete

Usage:

```
am> delete J2eeAgents --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action J2eeAgents --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action J2eeAgents --realm Realm --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action J2eeAgents --realm Realm --actionName nextdescendents
```

query

Querying the agents of a specific type

Usage:

```
am> query J2eeAgents --realm Realm --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read J2eeAgents --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update J2eeAgents --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",

JSONStdout

Realm Operations

Resource path: `/realm-config/services/audit/JSONStdout`

Resource version: `1.0`

create

Usage:

```
am> create JSONStdout --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "commonHandler" : {
      "type" : "object",
      "title" : "General Handler Configuration",
      "propertyOrder" : 0,
      "properties" : {
        "enabled" : {
          "title" : "Enabled",
          "description" : "Enables or disables an audit event handler.",
          "propertyOrder" : 300,
          "required" : true,
          "type" : "boolean",
          "exampleValue" : ""
        },
        "topics" : {
          "title" : "Topics",
          "description" : "List of topics handled by an audit event handler.",
          "propertyOrder" : 400,
          "required" : true,
          "items" : {
            "type" : "string"
          },
          "type" : "array",
          "exampleValue" : ""
        }
      }
    },
    "jsonConfig" : {
      "type" : "object",
      "title" : "JSON Configuration",
      "propertyOrder" : 2,
      "properties" : {
        "elasticsearchCompatible" : {
          "title" : "ElasticSearch JSON Format Compatible",
          "description" : "JSON format should be transformed to be compatible with  ElasticSearch
 format restrictions.",
          "propertyOrder" : 1700,
          "required" : true,
```

```
          "type" : "boolean",
          "exampleValue" : ""
        }
      }
    },
    "commonHandlerPlugin" : {
      "type" : "object",
      "title" : "Audit Event Handler Factory",
      "propertyOrder" : 1,
      "properties" : {
        "handlerFactory" : {
          "title" : "Factory Class Name",
          "description" : "The fully qualified class name of the factory
 responsible for creating the Audit Event Handler. The class must implement
 <code>org.forgerock.openam.audit.AuditEventHandlerFactory</code>.",
          "propertyOrder" : 1900,
          "required" : true,
          "type" : "string",
          "exampleValue" : ""
        }
      }
    }
  }
}
```

delete

Usage:

```
am> delete JSONStdout --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action JSONStdout --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action JSONStdout --realm Realm --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action JSONStdout --realm Realm --actionName nextdescendents
```

query

Get the full list of instances of this collection. This query only supports `_queryFilter=true` filter.

Usage:

```
am> query JSONStdout --realm Realm --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read JSONStdout --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update JSONStdout --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "commonHandler" : {
      "type" : "object",

          "description" : "The fully qualified class name of the factory
 responsible for creating the Audit Event Handler. The class must implement
 <code>org.forgerock.openam.audit.AuditEventHandlerFactory</code>.",
          "propertyOrder" : 1900,
          "required" : true,
          "type" : "string",
          "exampleValue" : ""
        }
      }
    }
  }
}
```

delete

Usage:

```
am> delete JSONStdout --global --id id
```

Parameters:

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action JSONStdout --global --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action JSONStdout --global --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action JSONStdout --global --actionName nextdescendents
```

query

Get the full list of instances of this collection. This query only supports `_queryFilter=true` filter.

Usage:

```
am> query JSONStdout --global --filter filter
```

Parameters:

`--filter`

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read JSONStdout --global --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update JSONStdout --global --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "commonHandler" : {
      "type" : "object",

  }
}
```

Jdbc

Realm Operations

Resource path: `/realm-config/services/audit/JDBC`

Resource version: `1.0`

create

Usage:

```
am> create Jdbc --realm Realm --id id --body body
```

Parameters:

`--id`

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "jdbcBuffering" : {
      "type" : "object",

  }
}
```

delete

Usage:

```
am> delete Jdbc --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action Jdbc --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action Jdbc --realm Realm --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action Jdbc --realm Realm --actionName nextdescendents
```

query

Get the full list of instances of this collection. This query only supports `_queryFilter=true` filter.

Usage:

```
am> query Jdbc --realm Realm --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read Jdbc --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update Jdbc --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",

Global Operations

Resource path: `/global-config/services/audit/JDBC`

Resource version: `1.0`

create

Usage:

```
am> create Jdbc --global --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "jdbcBuffering" : {
      "type" : "object",
      "title" : "Buffering",
      "propertyOrder" : 3,

}
```

delete

Usage:

```
am> delete Jdbc --global --id id
```

Parameters:

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action Jdbc --global --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action Jdbc --global --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action Jdbc --global --actionName nextdescendents
```

query

Get the full list of instances of this collection. This query only supports `_queryFilter=true` filter.

Usage:

```
am> query Jdbc --global --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read Jdbc --global --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update Jdbc --global --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",

      "required" : true,
```

```
      "type" : "string",
      "exampleValue" : ""
    }
  }
}
```

delete

Usage:

```
am> delete JdbcModule --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action JdbcModule --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action JdbcModule --realm Realm --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action JdbcModule --realm Realm --actionName nextdescendents
```

query

Get the full list of instances of this collection. This query only supports `_queryFilter=true` filter.

Usage:

```
am> query JdbcModule --realm Realm --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read JdbcModule --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update JdbcModule --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "passwordStatement" : {
      "title" : "Prepared Statement",
      "description" : "The SQL statement used to search the database for user passwords<br><br>The

    }
  }
}
```

Global Operations

Resource path: `/global-config/authentication/modules/jdbc`

Resource version: `1.0`

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action JdbcModule --global --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action JdbcModule --global --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action JdbcModule --global --actionName nextdescendents
```

read

Usage:

```
am> read JdbcModule --global
```

update

Usage:

```
am> update JdbcModule --global --body body
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```

}
```

delete

Usage:

```
am> delete Jms --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action Jms --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action Jms --realm Realm --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action Jms --realm Realm --actionName nextdescendents
```

query

Get the full list of instances of this collection. This query only supports `_queryFilter=true` filter.

Usage:

```
am> query Jms --realm Realm --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read Jms --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update Jms --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "jmsConfiguration" : {
      "type" : "object",
      "title" : "JMS Configuration",

      }
    }
  }
}
```

delete

Usage:

```
am> delete Jms --global --id id
```

Parameters:

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action Jms --global --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action Jms --global --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action Jms --global --actionName nextdescendents
```

query

Get the full list of instances of this collection. This query only supports `_queryFilter=true` filter.

Usage:

```
am> query Jms --global --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read Jms --global --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update Jms --global --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```

  }
}
```

delete

Usage:

```
am> delete Json --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action Json --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action Json --realm Realm --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action Json --realm Realm --actionName nextdescendents
```

query

Get the full list of instances of this collection. This query only supports `_queryFilter=true` filter.

Usage:

```
am> query Json --realm Realm --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read Json --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update Json --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```

      }
    }
  }
}
```

delete

Usage:

```
am> delete Json --global --id id
```

Parameters:

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action Json --global --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action Json --global --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action Json --global --actionName nextdescendents
```

query

Get the full list of instances of this collection. This query only supports `_queryFilter=true` filter.

Usage:

```
am> query Json --global --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read Json --global --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update Json --global --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "commonHandlerPlugin" : {
      "type" : "object",
      "title" : "Audit Event Handler Factory",

JwtProofOfPossessionModule

Realm Operations

Resource path: `/realm-config/authentication/modules/authJwtPoP`

Resource version: `1.0`

create

Usage:

```
am> create JwtProofOfPossessionModule --realm Realm --id id --body body
```

Parameters:

`--id`

The unique identifier for the resource.

`--body`

The resource in JSON format, described by the following JSON schema:

```
{
```

```
  "type" : "object",
  "properties" : {
    "challengeSigningKey" : {
      "title" : "Challenge Signing Key",
      "description" : "Name of the key (in the AM keystore) to use to sign challenges.",
      "propertyOrder" : 200,
      "required" : true,
      "type" : "string",
      "exampleValue" : ""
    },
    "subjectJwkSetAttr" : {
      "title" : "Subject JWK Set Attribute",
      "description" : "Subject profile attribute that contains a JWK Set of confirmation and
 encryption keys.",
      "propertyOrder" : 100,
      "required" : true,
      "type" : "string",
      "exampleValue" : ""
    },
    "responseEncryptionCipher" : {
      "title" : "Response Encryption Cipher",
      "description" : "The authenticated encryption (AEAD) scheme to use for the response.",
      "propertyOrder" : 350,
      "required" : true,
      "type" : "string",
      "exampleValue" : ""
    },
    "authenticationLevel" : {
      "title" : "Authentication Level",
      "description" : "The authentication level associated with this module.",
      "propertyOrder" : 10000,
      "required" : true,
      "type" : "integer",
      "exampleValue" : ""
    },
    "responseEncryptionMethod" : {
      "title" : "Response Encryption Scheme",
      "description" : "Key exchange method to use for responses: ephemeral elliptic curve Diffie-
Hellman (ECDHE)key agreement or using a pre-shared key (PSK) from the subject's JWK Set.",
      "propertyOrder" : 300,
      "required" : true,
      "type" : "string",
      "exampleValue" : ""
    },
    "enableTlsSessionBinding" : {
      "title" : "Use TLS Session Binding",
      "description" : "If enabled the response must arrive in the same TLS (HTTPS) session as the
 challenge was issued.",
      "propertyOrder" : 400,
      "required" : true,
      "type" : "boolean",
      "exampleValue" : ""
    }
  }
}
```

delete

Usage:

```
am> delete JwtProofOfPossessionModule --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action JwtProofOfPossessionModule --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action JwtProofOfPossessionModule --realm Realm --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action JwtProofOfPossessionModule --realm Realm --actionName nextdescendents
```

query

Get the full list of instances of this collection. This query only supports `_queryFilter=true` filter.

Usage:

```
am> query JwtProofOfPossessionModule --realm Realm --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read JwtProofOfPossessionModule --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update JwtProofOfPossessionModule --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "challengeSigningKey" : {
      "title" : "Challenge Signing Key",
      "description" : "Name of the key (in the AM keystore) to use to sign challenges.",
      "propertyOrder" : 200,
      "required" : true,
      "type" : "string",
      "exampleValue" : ""
    },
    "subjectJwkSetAttr" : {
      "title" : "Subject JWK Set Attribute",
      "description" : "Subject profile attribute that contains a JWK Set of confirmation and
 encryption keys.",
      "propertyOrder" : 100,
      "required" : true,
      "type" : "string",
      "exampleValue" : ""
    },
    "responseEncryptionCipher" : {
      "title" : "Response Encryption Cipher",
      "description" : "The authenticated encryption (AEAD) scheme to use for the response.",
      "propertyOrder" : 350,
```

```
      "required" : true,
      "type" : "string",
      "exampleValue" : ""
    },
    "authenticationLevel" : {
      "title" : "Authentication Level",
      "description" : "The authentication level associated with this module.",
      "propertyOrder" : 10000,
      "required" : true,
      "type" : "integer",
      "exampleValue" : ""
    },
    "responseEncryptionMethod" : {
      "title" : "Response Encryption Scheme",
      "description" : "Key exchange method to use for responses: ephemeral elliptic curve Diffie-
Hellman (ECDHE)key agreement or using a pre-shared key (PSK) from the subject's JWK Set.",
      "propertyOrder" : 300,
      "required" : true,
      "type" : "string",
      "exampleValue" : ""
    },
    "enableTlsSessionBinding" : {
      "title" : "Use TLS Session Binding",

      "propertyOrder" : 400,
      "required" : true,
      "type" : "boolean",
      "exampleValue" : ""
    }
  }
}
```

Global Operations

Resource path: `/global-config/authentication/modules/authJwtPoP`

Resource version: `1.0`

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action JwtProofOfPossessionModule --global --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action JwtProofOfPossessionModule --global --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action JwtProofOfPossessionModule --global --actionName nextdescendents
```

read

Usage:

```
am> read JwtProofOfPossessionModule --global
```

update

Usage:

```
am> update JwtProofOfPossessionModule --global --body body
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```

```

KBADecision

Realm Operations

Resource path: `/realm-config/authentication/authenticationtrees/nodes/KbaDecisionNode`

Resource version: `1.0`

create

Usage:

```
am> create KBADecision --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "identityAttribute" : {
      "title" : "Identity Attribute",
      "description" : "The attribute of the IDM object to use retrieve the object.",
      "propertyOrder" : 100,
      "type" : "string",
      "exampleValue" : ""
    }
  },
  "required" : [ "identityAttribute" ]
}
```

delete

Usage:

```
am> delete KBADecision --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action KBADecision --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action KBADecision --realm Realm --actionName getCreatableTypes
```

listOutcomes

List the available outcomes for the node type.

Usage:

```
am> action KBADecision --realm Realm --body body --actionName listOutcomes
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "title" : "Some configuration of the node. This does not need to be complete against the
 configuration schema."
}
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action KBADecision --realm Realm --actionName nextdescendents
```

query

Get the full list of instances of this collection. This query only supports `_queryFilter=true` filter.

Usage:

```
am> query KBADecision --realm Realm --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read KBADecision --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update KBADecision --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "identityAttribute" : {
      "title" : "Identity Attribute",
      "description" : "The attribute of the IDM object to use retrieve the object.",
      "propertyOrder" : 100,
      "type" : "string",
      "exampleValue" : ""
    }
  },
  "required" : [ "identityAttribute" ]
}
```

KBADefinition

Realm Operations

Resource path: `/realm-config/authentication/authenticationtrees/nodes/KbaCreateNode`

Resource version: `1.0`

create

Usage:

```
am> create KBADefinition --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "message" : {
      "title" : "Purpose Message",
      "description" : "Localised message describing the purpose of the data requested from the user.",
      "propertyOrder" : 100,
      "patternProperties" : {
        ".*" : {
          "type" : "string"
        }
      },
      "type" : "object",
      "exampleValue" : ""
    }
  },
  "required" : [ "message" ]
}
```

delete

Usage:

```
am> delete KBADefinition --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action KBADefinition --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action KBADefinition --realm Realm --actionName getCreatableTypes
```

listOutcomes

List the available outcomes for the node type.

Usage:

```
am> action KBADefinition --realm Realm --body body --actionName listOutcomes
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "title" : "Some configuration of the node. This does not need to be complete against the
 configuration schema."
}
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action KBADefinition --realm Realm --actionName nextdescendents
```

query

Get the full list of instances of this collection. This query only supports `_queryFilter=true` filter.

Usage:

```
am> query KBADefinition --realm Realm --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read KBADefinition --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update KBADefinition --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "message" : {
      "title" : "Purpose Message",
      "description" : "Localised message describing the purpose of the data requested from the user.",
      "propertyOrder" : 100,
      "patternProperties" : {
        ".*" : {
          "type" : "string"
        }
      },
      "type" : "object",
      "exampleValue" : ""
    }
  },
  "required" : [ "message" ]
}
```

KBAVerification

Realm Operations

Resource path: `/realm-config/authentication/authenticationtrees/nodes/KbaVerifyNode`

Resource version: `1.0`

create

Usage:

```
am> create KBAVerification --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "kbaInfoAttribute" : {
      "title" : "KBA Attribute",
      "description" : "The attribute in the user object in IDM where KBA questions and answers are
 stored.",
      "propertyOrder" : 100,
      "type" : "string",
      "exampleValue" : ""
    },
    "identityAttribute" : {
      "title" : "Identity Attribute",
      "description" : "The IDM attribute used to identify the object in a search, e.g. userName.",
      "propertyOrder" : 200,
      "type" : "string",
      "exampleValue" : ""
    }
  },
  "required" : [ "kbaInfoAttribute", "identityAttribute" ]
}
```

delete

Usage:

```
am> delete KBAVerification --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action KBAVerification --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action KBAVerification --realm Realm --actionName getCreatableTypes
```

listOutcomes

List the available outcomes for the node type.

Usage:

```
am> action KBAVerification --realm Realm --body body --actionName listOutcomes
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "title" : "Some configuration of the node. This does not need to be complete against the
 configuration schema."
}
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action KBAVerification --realm Realm --actionName nextdescendents
```

query

Get the full list of instances of this collection. This query only supports `_queryFilter=true` filter.

Usage:

```
am> query KBAVerification --realm Realm --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read KBAVerification --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update KBAVerification --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "kbaInfoAttribute" : {
      "title" : "KBA Attribute",
      "description" : "The attribute in the user object in IDM where KBA questions and answers are
 stored.",
      "propertyOrder" : 100,
      "type" : "string",
      "exampleValue" : ""
    },
    "identityAttribute" : {
      "title" : "Identity Attribute",
      "description" : "The IDM attribute used to identify the object in a search, e.g. userName.",
      "propertyOrder" : 200,
      "type" : "string",
      "exampleValue" : ""
    }
  },
  "required" : [ "kbaInfoAttribute", "identityAttribute" ]
}
```

KbaQuestions

Realm Operations

KBA resource is responsible for delivering up configured security questions.

Resource path: `/selfservice/kba`

Resource version: `1.0`

read

Read the configured security questions.

Usage:

```
am> read KbaQuestions --realm Realm
```

KerberosNode

Realm Operations

Resource path: `/realm-config/authentication/authenticationtrees/nodes/product-KerberosNode`

Resource version: `1.0`

create

Usage:

```
am> create KerberosNode --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "returnPrincipalWithDomainName" : {
      "title" : "Return Principal with Domain Name",
      "description" : "Returns the fully qualified name of the authenticated user rather than just the
 username.",
      "propertyOrder" : 600,
      "type" : "boolean",
      "exampleValue" : ""
    },
    "kerberosServiceIsInitiator" : {
      "title" : "Is Initiator",
      "description" : "True, if initiator. False, if acceptor only. Default is True.",
      "propertyOrder" : 800,
      "type" : "boolean",
      "exampleValue" : ""
    },
    "kerberosRealm" : {
      "title" : "Kerberos Realm",
      "description" : "The name of the Kerberos (Active Directory) realm used for authentication.",

 "trustedKerberosRealms", "kerberosServiceIsInitiator", "keytabFileName", "kerberosServerName",
 "lookupUserInRealm" ]
}
```

delete

Usage:

```
am> delete KerberosNode --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action KerberosNode --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action KerberosNode --realm Realm --actionName getCreatableTypes
```

listOutcomes

List the available outcomes for the node type.

Usage:

```
am> action KerberosNode --realm Realm --body body --actionName listOutcomes
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "title" : "Some configuration of the node. This does not need to be complete against the
 configuration schema."
}
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action KerberosNode --realm Realm --actionName nextdescendents
```

query

Get the full list of instances of this collection. This query only supports `_queryFilter=true` filter.

Usage:

```
am> query KerberosNode --realm Realm --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read KerberosNode --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update KerberosNode --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",

}
```

KeyStoreMappings

Realm Operations

Resource path: `/realm-config/secrets/stores/KeyStoreSecretStore/{KeyStoreSecretStore}/mappings`

Resource version: `1.0`

create

Usage:

```
am> create KeyStoreMappings --realm Realm --KeyStoreSecretStore KeyStoreSecretStore --id id --body body
```

Parameters:

--KeyStoreSecretStore

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "secretId" : {
      "title" : "Secret ID",
      "description" : "The secret ID that is to be associated with an alias.",
      "propertyOrder" : 100,
      "required" : true,
      "type" : "string",
      "exampleValue" : ""
    },
    "aliases" : {
      "title" : "Aliases",
      "description" : "The list of keystore aliases that can resolve the secret. The first element of
 the alias list determines which alias is the \"active\" one. Active secrets are used for signature
 generation and encryption, while the non-active secrets are mainly used for signature verification
 and decryption.",
      "propertyOrder" : 200,
      "required" : true,
      "items" : {
        "type" : "string",
        "minLength" : 1
      },
      "minItems" : 1,
      "uniqueItems" : true,
      "type" : "array",
      "exampleValue" : ""
    }
  }
}
```

delete

Usage:

```
am> delete KeyStoreMappings --realm Realm --KeyStoreSecretStore KeyStoreSecretStore --id id
```

Parameters:

--KeyStoreSecretStore

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action KeyStoreMappings --realm Realm --KeyStoreSecretStore KeyStoreSecretStore --actionName
 getAllTypes
```

Parameters:

--KeyStoreSecretStore

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action KeyStoreMappings --realm Realm --KeyStoreSecretStore KeyStoreSecretStore --actionName
 getCreatableTypes
```

Parameters:

--KeyStoreSecretStore

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action KeyStoreMappings --realm Realm --KeyStoreSecretStore KeyStoreSecretStore --actionName
 nextdescendents
```

Parameters:

--KeyStoreSecretStore

query

Get the full list of instances of this collection. This query only supports `_queryFilter=true` filter.

Usage:

```
am> query KeyStoreMappings --realm Realm --KeyStoreSecretStore KeyStoreSecretStore --filter filter
```

Parameters:

--KeyStoreSecretStore

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read KeyStoreMappings --realm Realm --KeyStoreSecretStore KeyStoreSecretStore --id id
```

Parameters:

--KeyStoreSecretStore

--id

The unique identifier for the resource.

update

Usage:

```
am> update KeyStoreMappings --realm Realm --KeyStoreSecretStore KeyStoreSecretStore --id id --body body
```

Parameters:

--KeyStoreSecretStore

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "secretId" : {
      "title" : "Secret ID",
      "description" : "The secret ID that is to be associated with an alias.",
      "propertyOrder" : 100,
      "required" : true,
      "type" : "string",
      "exampleValue" : ""
    },
    "aliases" : {
      "title" : "Aliases",
      "description" : "The list of keystore aliases that can resolve the secret. The first element of
 the alias list determines which alias is the \"active\" one. Active secrets are used for signature
 generation and encryption, while the non-active secrets are mainly used for signature verification
 and decryption.",
      "propertyOrder" : 200,
      "required" : true,
      "items" : {
        "type" : "string",
        "minLength" : 1
      },
      "minItems" : 1,
      "uniqueItems" : true,
      "type" : "array",
      "exampleValue" : ""
    }
  }
}
```

Global Operations

Resource path: `/global-config/secrets/stores/KeyStoreSecretStore/{KeyStoreSecretStore}/mappings`

Resource version: `1.0`

create

Usage:

```
am> create KeyStoreMappings --global --KeyStoreSecretStore KeyStoreSecretStore --id id --body body
```

Parameters:

--KeyStoreSecretStore

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "aliases" : {
      "title" : "Aliases",
      "description" : "The list of keystore aliases that can resolve the secret. The first element of
 the alias list determines which alias is the \"active\" one. Active secrets are used for signature
 generation and encryption, while the non-active secrets are mainly used for signature verification
 and decryption.",
      "propertyOrder" : 200,
      "required" : true,

      },
      "minItems" : 1,
      "uniqueItems" : true,
      "type" : "array",
      "exampleValue" : ""
    },
    "secretId" : {
      "title" : "Secret ID",
      "description" : "The secret ID that is to be associated with an alias.",
      "propertyOrder" : 100,
      "required" : true,
      "type" : "string",
      "exampleValue" : ""
    }
  }
}
```

delete

Usage:

```
am> delete KeyStoreMappings --global --KeyStoreSecretStore KeyStoreSecretStore --id id
```

Parameters:

--KeyStoreSecretStore

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action KeyStoreMappings --global --KeyStoreSecretStore KeyStoreSecretStore --actionName getAllTypes
```

Parameters:

--KeyStoreSecretStore

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action KeyStoreMappings --global --KeyStoreSecretStore KeyStoreSecretStore --actionName
 getCreatableTypes
```

Parameters:

--KeyStoreSecretStore

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action KeyStoreMappings --global --KeyStoreSecretStore KeyStoreSecretStore --actionName
 nextdescendents
```

Parameters:

--KeyStoreSecretStore

query

Get the full list of instances of this collection. This query only supports `_queryFilter=true` filter.

Usage:

```
am> query KeyStoreMappings --global --KeyStoreSecretStore KeyStoreSecretStore --filter filter
```

Parameters:

--KeyStoreSecretStore

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read KeyStoreMappings --global --KeyStoreSecretStore KeyStoreSecretStore --id id
```

Parameters:

--KeyStoreSecretStore

--id

The unique identifier for the resource.

update

Usage:

```
am> update KeyStoreMappings --global --KeyStoreSecretStore KeyStoreSecretStore --id id --body body
```

Parameters:

--KeyStoreSecretStore

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "aliases" : {
      "title" : "Aliases",
      "description" : "The list of keystore aliases that can resolve the secret. The first element of
 the alias list determines which alias is the \"active\" one. Active secrets are used for signature
 generation and encryption, while the non-active secrets are mainly used for signature verification
 and decryption.",
      "propertyOrder" : 200,
      "required" : true,
      "items" : {
        "type" : "string",
        "minLength" : 1
      },
      "minItems" : 1,
      "uniqueItems" : true,
      "type" : "array",
      "exampleValue" : ""
    },
    "secretId" : {
      "title" : "Secret ID",
      "description" : "The secret ID that is to be associated with an alias.",
      "propertyOrder" : 100,
      "required" : true,
      "type" : "string",
      "exampleValue" : ""
    }
  }
}
```

KeyStoreSecretStore

Realm Operations

Resource path: `/realm-config/secrets/stores/KeyStoreSecretStore`

Resource version: `1.0`

create

Usage:

```
am> create KeyStoreSecretStore --realm Realm --id id --body body
```

Parameters:

`--id`

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "leaseExpiryDuration" : {
      "title" : "Key lease expiry",
      "description" : "The amount of minutes a key can be cached from the keystore before it needs to
 be reloaded.",

      "exampleValue" : ""
    }
  }
}
```

delete

Usage:

```
am> delete KeyStoreSecretStore --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action KeyStoreSecretStore --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action KeyStoreSecretStore --realm Realm --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action KeyStoreSecretStore --realm Realm --actionName nextdescendents
```

query

Get the full list of instances of this collection. This query only supports `_queryFilter=true` filter.

Usage:

```
am> query KeyStoreSecretStore --realm Realm --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read KeyStoreSecretStore --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update KeyStoreSecretStore --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "leaseExpiryDuration" : {
      "title" : "Key lease expiry",

      "exampleValue" : ""
    }
  }
}
```

delete

Usage:

```
am> delete KeyStoreSecretStore --global --id id
```

Parameters:

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action KeyStoreSecretStore --global --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action KeyStoreSecretStore --global --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action KeyStoreSecretStore --global --actionName nextdescendents
```

query

Get the full list of instances of this collection. This query only supports `_queryFilter=true` filter.

Usage:

```
am> query KeyStoreSecretStore --global --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read KeyStoreSecretStore --global --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update KeyStoreSecretStore --global --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "file" : {
      "title" : "File",

}
```

delete

Usage:

```
am> delete LDAPDecision --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action LDAPDecision --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action LDAPDecision --realm Realm --actionName getCreatableTypes
```

listOutcomes

List the available outcomes for the node type.

Usage:

```
am> action LDAPDecision --realm Realm --body body --actionName listOutcomes
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "title" : "Some configuration of the node. This does not need to be complete against the
 configuration schema."
}
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action LDAPDecision --realm Realm --actionName nextdescendents
```

query

Get the full list of instances of this collection. This query only supports `_queryFilter=true` filter.

Usage:

```
am> query LDAPDecision --realm Realm --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read LDAPDecision --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update LDAPDecision --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```

Usage:

```
am> delete LdapModule --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action LdapModule --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action LdapModule --realm Realm --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action LdapModule --realm Realm --actionName nextdescendents
```

query

Get the full list of instances of this collection. This query only supports `_queryFilter=true` filter.

Usage:

```
am> query LdapModule --realm Realm --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read LdapModule --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update LdapModule --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {

Global Operations

Resource path: `/global-config/authentication/modules/ldap`

Resource version: `1.0`

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action LdapModule --global --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action LdapModule --global --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action LdapModule --global --actionName nextdescendents
```

read

Usage:

```
am> read LdapModule --global
```

update

Usage:

```
am> update LdapModule --global --body body
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "defaults" : {
      "properties" : {
        "minimumPasswordLength" : {

```

delete

Usage:

```
am> delete LegacyUserSelfService --realm Realm
```

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action LegacyUserSelfService --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action LegacyUserSelfService --realm Realm --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action LegacyUserSelfService --realm Realm --actionName nextdescendents
```

read

Usage:

```
am> read LegacyUserSelfService --realm Realm
```

update

Usage:

```

    },
    "userInfoEndpoint" : {
      "title" : "User Profile Service URL",
      "description" : "User profile information URL <p> This URL endpoint provides user profile
 information and is provided by the OAuth Identity Provider NB This URL should return JSON objects in
 response.",
      "propertyOrder" : 600,
      "required" : true,
      "type" : "string",
      "exampleValue" : ""
    }
  }
}
```

delete

Usage:

```
am> delete LinkedInClient --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action LinkedInClient --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action LinkedInClient --realm Realm --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action LinkedInClient --realm Realm --actionName nextdescendents
```

query

Get the full list of instances of this collection. This query only supports `_queryFilter=true` filter.

Usage:

```
am> query LinkedInClient --realm Realm --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read LinkedInClient --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update LinkedInClient --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "tokenEndpoint" : {
      "title" : "Access Token Endpoint URL",
      "description" : "OAuth access token endpoint URL This is the URL endpoint for access token
 retrieval provided by the OAuth Identity Provider.Refer to the RFC 6749 (http://tools.ietf.org/html/

Logging

Global Operations

Resource path: `/global-config/services/logging`

Resource version: `1.0`

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action Logging --global --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action Logging --global --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action Logging --global --actionName nextdescendents
```

read

Usage:

```
am> read Logging --global
```

update

Usage:

```
am> update Logging --global --body body
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "general" : {
      "type" : "object",
      "title" : "General",
      "propertyOrder" : 0,
      "properties" : {
        "verifyPeriod" : {
          "title" : "Log Verification Frequency",
          "description" : "The frequency (in seconds) that OpenAM verifies security of the log
 files.<br><br>When secure logging is enabled, this is the period that OpenAM will check the integrity
 of the log files.",
          "propertyOrder" : 2000,
```

```

        }
      }
    }
  }
}
```

LoginCountDecision

Realm Operations

Resource path: `/realm-config/authentication/authenticationtrees/nodes/LoginCountDecisionNode`

Resource version: `1.0`

create

Usage:

```
am> create LoginCountDecision --realm Realm --id id --body body
```

Parameters:

`--id`

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "identityAttribute" : {
      "title" : "Identity Attribute",
      "description" : "The attribute of the IDM object to use retrieve the object.",
      "propertyOrder" : 300,
      "type" : "string",
      "exampleValue" : ""
    },
    "interval" : {
      "title" : "Interval",
      "description" : "The interval type for which the decision should occur. Valid types are 'every'
 and 'at'.",
      "propertyOrder" : 100,
      "type" : "string",
      "exampleValue" : ""
    },
    "amount" : {
      "title" : "Amount",
      "description" : "The amount (count) of logins for the interval.",
      "propertyOrder" : 200,
      "type" : "integer",
      "exampleValue" : ""
    }
  },
  "required" : [ "identityAttribute", "interval", "amount" ]
}
```

delete

Usage:

```
am> delete LoginCountDecision --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action LoginCountDecision --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action LoginCountDecision --realm Realm --actionName getCreatableTypes
```

listOutcomes

List the available outcomes for the node type.

Usage:

```
am> action LoginCountDecision --realm Realm --body body --actionName listOutcomes
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "title" : "Some configuration of the node. This does not need to be complete against the
 configuration schema."
}
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action LoginCountDecision --realm Realm --actionName nextdescendents
```

query

Get the full list of instances of this collection. This query only supports `_queryFilter=true` filter.

Usage:

```
am> query LoginCountDecision --realm Realm --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read LoginCountDecision --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update LoginCountDecision --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "identityAttribute" : {
      "title" : "Identity Attribute",
      "description" : "The attribute of the IDM object to use retrieve the object.",
      "propertyOrder" : 300,
      "type" : "string",
      "exampleValue" : ""
    },
    "interval" : {
      "title" : "Interval",
      "description" : "The interval type for which the decision should occur. Valid types are 'every'
 and 'at'.",
      "propertyOrder" : 100,
      "type" : "string",
      "exampleValue" : ""
    },
    "amount" : {
      "title" : "Amount",
      "description" : "The amount (count) of logins for the interval.",
      "propertyOrder" : 200,
      "type" : "integer",
      "exampleValue" : ""
    }
  },
  "required" : [ "identityAttribute", "interval", "amount" ]
}
```

MembershipModule

Realm Operations

Resource path: `/realm-config/authentication/modules/membership`

Resource version: `1.0`

create

Usage:

```
am> create MembershipModule --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "defaultUserStatus" : {
      "title" : "User Status After Registration",
      "description" : "Determines if the user account should be automatically active after
 registration completes.",
      "propertyOrder" : 300,
      "required" : true,
      "type" : "string",
      "exampleValue" : ""
    },
    "authenticationLevel" : {
      "title" : "Authentication Level",
      "description" : "The authentication level associated with this module.<br><br>Each
 authentication module has an authentication level that can be used to indicate the level of security
 associated with the module; 0 is the lowest (and the default).",
      "propertyOrder" : 400,
      "required" : true,
      "type" : "integer",
      "exampleValue" : ""
    },
    "minimumPasswordLength" : {
      "title" : "Minimum Password Length",
      "description" : "The minimum length of the user password.<br><br>Setting this value to 0
 disables this functionality.<br/><br/><i>NB </i>This feature is separate from any password policy in
 the underlying data store",
      "propertyOrder" : 100,
```

```
      "required" : true,
      "type" : "integer",
      "exampleValue" : ""
    },
    "defaultUserRoles" : {
      "title" : "Default User Roles",
      "description" : "The role DN's that will be assigned to the user.<br><br><i>NB </i>Roles are
 only supported in Sun Directory Server Enterprise Edition",
      "propertyOrder" : 200,
      "required" : true,
      "items" : {
        "type" : "string"
      },
      "type" : "array",
      "exampleValue" : ""
    }
  }
}
```

delete

Usage:

```
am> delete MembershipModule --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action MembershipModule --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action MembershipModule --realm Realm --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action MembershipModule --realm Realm --actionName nextdescendents
```

query

Get the full list of instances of this collection. This query only supports `_queryFilter=true` filter.

Usage:

```
am> query MembershipModule --realm Realm --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read MembershipModule --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update MembershipModule --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "defaultUserStatus" : {
```

```
      "title" : "User Status After Registration",
      "description" : "Determines if the user account should be automatically active after
 registration completes.",
      "propertyOrder" : 300,
      "required" : true,
      "type" : "string",
      "exampleValue" : ""
    },
    "authenticationLevel" : {
      "title" : "Authentication Level",
      "description" : "The authentication level associated with this module.<br><br>Each
 authentication module has an authentication level that can be used to indicate the level of security
 associated with the module; 0 is the lowest (and the default).",
      "propertyOrder" : 400,
      "required" : true,
      "type" : "integer",
      "exampleValue" : ""
    },
    "minimumPasswordLength" : {
      "title" : "Minimum Password Length",
      "description" : "The minimum length of the user password.<br><br>Setting this value to 0
 disables this functionality.<br/><br/><i>NB </i>This feature is separate from any password policy in
 the underlying data store",
      "propertyOrder" : 100,
      "required" : true,
      "type" : "integer",
      "exampleValue" : ""
    },
    "defaultUserRoles" : {
      "title" : "Default User Roles",
      "description" : "The role DN's that will be assigned to the user.<br><br><i>NB </i>Roles are
 only supported in Sun Directory Server Enterprise Edition",
      "propertyOrder" : 200,
      "required" : true,
      "items" : {
        "type" : "string"
      },
      "type" : "array",
      "exampleValue" : ""
    }
  }
}
```

Global Operations

Resource path: `/global-config/authentication/modules/membership`

Resource version: `1.0`

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action MembershipModule --global --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action MembershipModule --global --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action MembershipModule --global --actionName nextdescendents
```

read

Usage:

```
am> read MembershipModule --global
```

update

Usage:

```
am> update MembershipModule --global --body body
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "defaults" : {
      "properties" : {
        "defaultUserRoles" : {
          "title" : "Default User Roles",
          "description" : "The role DN's that will be assigned to the user.<br><br><i>NB </i>Roles are
 only supported in Sun Directory Server Enterprise Edition",
          "propertyOrder" : 200,
          "required" : true,
          "items" : {
            "type" : "string"
          },
```

```
          "type" : "array",
          "exampleValue" : ""
        },
        "authenticationLevel" : {
          "title" : "Authentication Level",
          "description" : "The authentication level associated with this module.<br><br>Each
 authentication module has an authentication level that can be used to indicate the level of security
 associated with the module; 0 is the lowest (and the default).",
          "propertyOrder" : 400,
          "required" : true,
          "type" : "integer",
          "exampleValue" : ""
        },
        "minimumPasswordLength" : {
          "title" : "Minimum Password Length",
          "description" : "The minimum length of the user password.<br><br>Setting this value to 0
 disables this functionality.<br/><br/><i>NB </i>This feature is separate from any password policy in
 the underlying data store",

          "type" : "string",
          "exampleValue" : ""
        }
      },
      "type" : "object",
      "title" : "Realm Defaults"
    }
  }
}
```

MessageNode

Realm Operations

Resource path: `/realm-config/authentication/authenticationtrees/nodes/MessageNode`

Resource version: `1.0`

create

Usage:

```
am> create MessageNode --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "message" : {
      "title" : "Message",
      "description" : "Localisation overrides - as key fill shortcut for language (first will be used
 as default if not empty or \"Default message\" if empty), value is message for language defined by
 key.",
      "propertyOrder" : 100,
      "patternProperties" : {
        ".*" : {
          "type" : "string"
        }
      },
      "type" : "object",
      "exampleValue" : ""
    },
    "stateField" : {
      "title" : "Shared State Property Name",
      "description" : "",
      "propertyOrder" : 400,
      "type" : "string",
      "exampleValue" : ""
    },
    "messageNo" : {
      "title" : "Negative answer",
      "description" : "Localisation overrides - as key fill shortcut for language (first will be used
 as default if not empty or \"No\" if empty), value is negative answer for language defined by key.",
      "propertyOrder" : 300,
      "patternProperties" : {
        ".*" : {
          "type" : "string"
        }
      },
      "type" : "object",
      "exampleValue" : ""
    },
    "messageYes" : {
      "title" : "Positive answer",
      "description" : "Localisation overrides - as key fill shortcut for language (first will be used
 as default if not empty or \"Yes\" if empty), value is positive answer for language defined by key.",
      "propertyOrder" : 200,
      "patternProperties" : {
        ".*" : {
          "type" : "string"
```

```
        }
      },
      "type" : "object",
      "exampleValue" : ""
    }
  },
  "required" : [ "message", "messageYes", "messageNo" ]
}
```

delete

Usage:

```
am> delete MessageNode --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action MessageNode --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action MessageNode --realm Realm --actionName getCreatableTypes
```

listOutcomes

List the available outcomes for the node type.

Usage:

```
am> action MessageNode --realm Realm --body body --actionName listOutcomes
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "title" : "Some configuration of the node. This does not need to be complete against the
 configuration schema."
}
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action MessageNode --realm Realm --actionName nextdescendents
```

query

Get the full list of instances of this collection. This query only supports `_queryFilter=true` filter.

Usage:

```
am> query MessageNode --realm Realm --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read MessageNode --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update MessageNode --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "message" : {
      "title" : "Message",
      "description" : "Localisation overrides - as key fill shortcut for language (first will be used
 as default if not empty or \"Default message\" if empty), value is message for language defined by
 key.",
      "propertyOrder" : 100,
      "patternProperties" : {
        ".*" : {
          "type" : "string"
        }
      },
      "type" : "object",
      "exampleValue" : ""
    },
    "stateField" : {
      "title" : "Shared State Property Name",
      "description" : "",
      "propertyOrder" : 400,
      "type" : "string",
      "exampleValue" : ""
    },
    "messageNo" : {
      "title" : "Negative answer",
      "description" : "Localisation overrides - as key fill shortcut for language (first will be used
 as default if not empty or \"No\" if empty), value is negative answer for language defined by key.",
      "propertyOrder" : 300,
      "patternProperties" : {
        ".*" : {
          "type" : "string"
        }
      },
      "type" : "object",
      "exampleValue" : ""
    },
    "messageYes" : {
      "title" : "Positive answer",
      "description" : "Localisation overrides - as key fill shortcut for language (first will be used
 as default if not empty or \"Yes\" if empty), value is positive answer for language defined by key.",
      "propertyOrder" : 200,
      "patternProperties" : {
        ".*" : {
          "type" : "string"
        }
      },
      "type" : "object",
      "exampleValue" : ""
    }
  },
```

```
  "required" : [ "message", "messageYes", "messageNo" ]
}
```

Meter

Realm Operations

Resource path: `/realm-config/authentication/authenticationtrees/nodes/MeterNode`

Resource version: `1.0`

create

Usage:

```
am> create Meter --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "metricKey" : {
      "title" : "Metric Key",
      "description" : "Identifier of metric to update when this node is processed.",
      "propertyOrder" : 100,
      "type" : "string",
      "exampleValue" : ""
    }
  },
  "required" : [ "metricKey" ]
}
```

delete

Usage:

```
am> delete Meter --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action Meter --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action Meter --realm Realm --actionName getCreatableTypes
```

listOutcomes

List the available outcomes for the node type.

Usage:

```
am> action Meter --realm Realm --body body --actionName listOutcomes
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "title" : "Some configuration of the node. This does not need to be complete against the
 configuration schema."
}
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action Meter --realm Realm --actionName nextdescendents
```

query

Get the full list of instances of this collection. This query only supports `_queryFilter=true` filter.

Usage:

```
am> query Meter --realm Realm --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read Meter --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update Meter --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "metricKey" : {
      "title" : "Metric Key",
      "description" : "Identifier of metric to update when this node is processed.",
      "propertyOrder" : 100,
      "type" : "string",
      "exampleValue" : ""
    }
  },
  "required" : [ "metricKey" ]
}
```

ModifyAuthLevel

Realm Operations

Resource path: `/realm-config/authentication/authenticationtrees/nodes/ModifyAuthLevelNode`

Resource version: `1.0`

create

Usage:

```
am> create ModifyAuthLevel --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "authLevelIncrement" : {
      "title" : "Value To Add",
      "description" : "Value which is added to the authentication level.Value may be negative to
 decrease the authentication level.",
      "propertyOrder" : 100,
      "type" : "integer",
      "exampleValue" : ""
    }
  },
  "required" : [ "authLevelIncrement" ]
}
```

delete

Usage:

```
am> delete ModifyAuthLevel --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action ModifyAuthLevel --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action ModifyAuthLevel --realm Realm --actionName getCreatableTypes
```

listOutcomes

List the available outcomes for the node type.

Usage:

```
am> action ModifyAuthLevel --realm Realm --body body --actionName listOutcomes
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "title" : "Some configuration of the node. This does not need to be complete against the
 configuration schema."
}
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action ModifyAuthLevel --realm Realm --actionName nextdescendents
```

query

Get the full list of instances of this collection. This query only supports `_queryFilter=true` filter.

Usage:

```
am> query ModifyAuthLevel --realm Realm --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read ModifyAuthLevel --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update ModifyAuthLevel --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "authLevelIncrement" : {
      "title" : "Value To Add",
      "description" : "Value which is added to the authentication level.Value may be negative to
 decrease the authentication level.",
      "propertyOrder" : 100,
      "type" : "integer",
      "exampleValue" : ""
    }
  },
  "required" : [ "authLevelIncrement" ]
}
```

Monitoring

Global Operations

Resource path: `/global-config/services/monitoring`

Resource version: `1.0`

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action Monitoring --global --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action Monitoring --global --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action Monitoring --global --actionName nextdescendents
```

read

Usage:

```
am> read Monitoring --global
```

update

Usage:

```
am> update Monitoring --global --body body
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "snmpEnabled" : {
      "title" : "Monitoring SNMP interface status",
      "description" : "Enable / Disable the SNMP access to the monitoring system",

}
```

MsisdnModule

Realm Operations

Resource path: `/realm-config/authentication/modules/msisdn`

Resource version: `1.0`

create

Usage:

```
am> create MsisdnModule --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "userProfileMsisdnAttribute" : {
      "title" : "Attribute To Use To Search LDAP",

    }
  }
}
```

delete

Usage:

```
am> delete MsisdnModule --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action MsisdnModule --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action MsisdnModule --realm Realm --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action MsisdnModule --realm Realm --actionName nextdescendents
```

query

Get the full list of instances of this collection. This query only supports `_queryFilter=true` filter.

Usage:

```
am> query MsisdnModule --realm Realm --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read MsisdnModule --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update MsisdnModule --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {

```

Global Operations

Resource path: `/global-config/authentication/modules/msisdn`

Resource version: `1.0`

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action MsisdnModule --global --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action MsisdnModule --global --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action MsisdnModule --global --actionName nextdescendents
```

read

Usage:

```
am> read MsisdnModule --global
```

update

Usage:

```
am> update MsisdnModule --global --body body
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "defaults" : {
      "properties" : {
        "ldapUserBindDN" : {
          "title" : "LDAP Server Authentication User ",
          "description" : "DN of the user used by the module to authenticate to the LDAP
 server<br><br>The MSISDN module authenticates to the LDAP server in order to search for a matching
 number. The DN entered here represents the account used for said authentication and must have read/
search access to the LDAP server.",

MultiFederationProtocol

Global Operations

Resource path: `/global-config/services/federation/multi`

Resource version: `1.0`

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action MultiFederationProtocol --global --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action MultiFederationProtocol --global --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action MultiFederationProtocol --global --actionName nextdescendents
```

read

Usage:

```
am> read MultiFederationProtocol --global
```

update

Usage:

```
am> update MultiFederationProtocol --global --body body
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "singleLogoutHandlerList" : {
      "title" : "Single Logout Handler List",
      "description" : "List of Logout handlers for each supported federation protocol<br><br>The
 multi-federation protocol engine supports Single Logout. Each federation protocol
 requires a different single logout handler. Logout handler must implement the
 <code>com.sun.identity.multiprotocol.SingleLogoutHandler</code> interface.",
      "propertyOrder" : 100,
      "required" : true,
      "items" : {
        "type" : "string"
      },
      "type" : "array",
      "exampleValue" : ""
    }
  }
}
```

Naming

Global Operations

Resource path: `/global-config/services/naming`

Resource version: `1.0`

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action Naming --global --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action Naming --global --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action Naming --global --actionName nextdescendents
```

read

Usage:

```
am> read Naming --global
```

update

Usage:

```
am> update Naming --global --body body
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```

}
```

delete

Usage:

```
am> delete OAuth20 --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action OAuth20 --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action OAuth20 --realm Realm --actionName getCreatableTypes
```

listOutcomes

List the available outcomes for the node type.

Usage:

```
am> action OAuth20 --realm Realm --body body --actionName listOutcomes
```

Parameters:

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "title" : "Some configuration of the node. This does not need to be complete against the
 configuration schema."
}
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action OAuth20 --realm Realm --actionName nextdescendents
```

query

Get the full list of instances of this collection. This query only supports `_queryFilter=true` filter.

Usage:

```
am> query OAuth20 --realm Realm --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read OAuth20 --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update OAuth20 --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "tokenEndpoint" : {
      "title" : "Access Token Endpoint URL",
      "description" : "OAuth access token endpoint URL This is the URL endpoint for access token
 retrieval provided by the OAuth Identity Provider.Refer to the RFC 6749 (http://tools.ietf.org/html/
rfc6749#section-3.2), section 3.2.",
      "propertyOrder" : 400,
      "type" : "string",
      "exampleValue" : ""
    },
```

```
   "saveUserAttributesToSession" : {

OAuth2Client

Realm Operations

Resource path: `/realm-config/services/SocialIdentityProviders/oauth2Config`

Resource version: `1.0`

create

Usage:

```
am> create OAuth2Client --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "transform" : {
      "title" : "Transform Script",
      "description" : "A script that takes the raw profile object as input and outputs the normalized
 profile object.",

      "required" : true,
      "type" : "string",
```

```
      "exampleValue" : ""
    }
  }
}
```

delete

Usage:

```
am> delete OAuth2Client --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action OAuth2Client --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action OAuth2Client --realm Realm --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action OAuth2Client --realm Realm --actionName nextdescendents
```

query

Get the full list of instances of this collection. This query only supports `_queryFilter=true` filter.

Usage:

```
am> query OAuth2Client --realm Realm --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read OAuth2Client --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update OAuth2Client --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {

  }
}
```

delete

Usage:

```
am> delete OAuth2ClientAgentGroups --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

getAllTypes

Obtain the collection of all secondary configuration types related to the resource.

Usage:

```
am> action OAuth2ClientAgentGroups --realm Realm --actionName getAllTypes
```

getCreatableTypes

Obtain the collection of secondary configuration types that have yet to be added to the resource.

Usage:

```
am> action OAuth2ClientAgentGroups --realm Realm --actionName getCreatableTypes
```

nextdescendents

Obtain the collection of secondary configuration instances that have been added to the resource.

Usage:

```
am> action OAuth2ClientAgentGroups --realm Realm --actionName nextdescendents
```

query

Querying the agent groups of a specific type

Usage:

```
am> query OAuth2ClientAgentGroups --realm Realm --filter filter
```

Parameters:

--filter

A CREST formatted query filter, where "true" will query all.

read

Usage:

```
am> read OAuth2ClientAgentGroups --realm Realm --id id
```

Parameters:

--id

The unique identifier for the resource.

update

Usage:

```
am> update OAuth2ClientAgentGroups --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```

OAuth2Clients

Realm Operations

Agents handler that is responsible for managing agents

Resource path: `/realm-config/agents/OAuth2Client`

Resource version: `1.0`

create

Usage:

```
am> create OAuth2Clients --realm Realm --id id --body body
```

Parameters:

--id

The unique identifier for the resource.

--body

The resource in JSON format, described by the following JSON schema:

```
{
  "type" : "object",
  "properties" : {
    "coreOAuth2ClientConfig" : {
      "type" : "object",
